That's peculiar. PCI 100BaseT NICs are down to $20 these days.
The real problem is having a free PCI slot. I had to resort to
ISA for a machine that had run out of PCI slots.

[deletia]

You don't need to be running a 5 year old machine to be in
the position where an ISA card is your only option.

Linux requires fiddling to run at all on certain PS/2 models.

MCA isn't that bad in theory, actually quite able
>to compete with PCI according to what I've heard, but its "autoconfig" or

>"plug'n'play" is appalling, requiring a disk-based configuration.

Right, and the configuration procedure can be quite painfull. (speaking from
experience ;-(

How come
>they throw BASIC into the ROM, but not the most basic config utilities?

Because IBM used to charge a pretty penny for the configuration disks, or
reference disks as they called them. The BASIC was just a remnant from the
original IBM PC, including the casette support.

: If it fits on the single boot disk, then it fits on the single
: boot disk end of story. It doesn't matter what 'better tech' is
: being used to get more out of the boot medium.

If it fit onto a single disk then it wouldn't eat up four megabytes of RAM
decompressing. It isn't any standard 1,44 floppy.

: The end result remains the same.

Oh, you're so pragmatic.

: [deletia]

: No version of Windows worth running is going to fit on a floppy.

I suppose you're correct there. Still, it's no that impressive a feat,
considering that it isn't Windows.

So? I could manage to get ~ 1M uncompressed out of DD ST
formated FAT16 disks using a particular Frech Formatter
and impecable media as well as impecable hardware.

Use an extended FAT format with a HD disk and fairly mundane
levels of file compression and 4M on a floppy disk isn't that
much of a stretch.

That's not the point. QNX is infact a superset of Windows in
any of it's forms. It just so happens that QNX is both more
modular and more efficient than WinDOS.

IBM wanted a substantial royalty from any manufacturer that produced/sold systems incorporating MCA. A royalty on _every_ computer sold with MCA in fact.

Most manufacturers, with a few exceptions, decided IBM could stick their royalties and the MCA bus where the sun don't shine.

Regards,

Clockmeister.

5389. Fwd: ZDNet G4 vs. PIII/Athlon benchmarks

5391. If Using A Mac Is so Easy for the 'Clap....

Newsgroup: comp.sys.atari.advocacy
Date: 2000-05-29 00:00:00 UTC
From: Mayor Of R'lyeh <ev515o@hotmail.com>
Message-ID: <noone-A5CF7C.09053629052000@bigmomma.idirect.com>
Source record: 1656

...why does it cause so many problems for people?

The APA has a study that claims to show a link between playing video games and violent behavior. Upon reading the thing you notice that they only tested people using a Mac. Could it be that using the Mac is what caused this increase in violent behavior? I know the few times I've used one its so-called 'intuitive' GUI struck me as the most illogical thing I've ever seen and nearly drove me 'round the bend.

The relevant passage is:

"For the first session, participants were scheduled in pairs to come into the laboratory for 1 hour. Upon arriving at the laboratory, each participant was escorted to a cubicle that contained an intercom and a chair facing a color Macintosh computer equipped with a voice key (MacRecorder) and a pair of headphones. A female experimenter asked each participant to read and sign a consent form, to read a brief overview of the study, and to familiarize themselves with instructions that explained how to play the video game to which they were assigned (either Myst or Wolfenstein 3D). The experimenter then informed the participant that she would contact them when she was ready to begin and closed the door to the participant's cubicle."

The full text is at:
http://www.apa.org/journals/psp/psp784772.html

Could this be real cause of the drought of games for the Mac? Are Game makers just being socially responsible?
Cuss and discuss.

Mac X public beta will be here summer time most likely at MacWorld in
July...Nice try! Lets see...What did Apple release this year in terms
of hardware and software?

5397. Milan News - "Vapor" This, 'Clap!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-06-04 00:00:00 UTC
From: Dan <aahuls@xs4all.nl>
Message-ID: <noone-460603.09571004062000@bigmomma.idirect.com>
Source record: 1662

some news on the upcoming Milan II.

Perhaps the 'Clap, who is obviously simmering after the one-two-three punch of no Mac OSX this summer, iMac sales tanking, and one of his mortal enemies getting a web site job, will now do the honorable thing and flush himself down the crapper along with his now-worthless Corel stock....

Hello,
Received a flyer today with news about the Atari/Amiga expo in Neuss. I quote :
The new Milan II will definitely be presented on a 60m2 stand.
The national and international press will be present as well as the TV (there will be a 8
minute WDR broadcasting about the Milan on June 10th.
Besides the presentation of the Milan II, there will be many new Milan II goodies : new
comfortable System-Manager, Resolution-Switcher with integrated Themes-Manager, new
glow-Icons and more.
If the system sells well, computers with integrated TFT display, Milan based Web-Pads,
Tos compatible Pocket organisers will follow.
Presentation of design-studies for the next generation Milans (PPC ?)
Presentation of the new Milan HDrecording software "Take".
Bubbles will be the new official Milan screensaver.
New version of CD recorder 3
Introduction of the "Papyrus killer" : Tempus Word 4.0 (scanning integrated)
etc.......etc......etc........
Also sensational Amiga presentations !

See you in Neuss
Dan

Milan 040 - Magic Milan

and now, some reactions to this: which will further dilute the 'Clap's noise pollution. (of course, this can be miminized if he gargles with Drano....)

Hello Lyndon,

>>Besides the presentation of the Milan II, there will be many new Milan II goodies : new
>>comfortable System-Manager, Resolution-Switcher with integrated

Themes-Manager,
>new
>>glow-Icons and more.
>
>Glow-icons?! - sounds smart anyway

They were shown in the German mag STC. They look nice and start to
"glow" when selected
If Milan wants to sell to new customers, the looks have to be good.
>
>>Bubbles will be the new official Milan screensaver.
>Bubbles is ancient isn't it?

Maybe it has been updated ? I'll try to find out.

>>Introduction of the "Papyrus killer" : Tempus Word 4.0 (scanning
integrated)
>Well never tried Tempus (own papyrus). It must be good to beat
>Tempus.

You can download a "pre" version at http://www.tempus-word.de
After years of silence the development of this well known word processor
software (in
Germany) is continued. I heard a rumour that it will be translated in
English. It is said
that M$ took it as an example for it's wordprocessor.
>
>>Also sensational Amiga presentations !
>Hmm yeah OK. I think the Atari side will will win people over.

I hope it doesn't end in a riot between Atari and Amiga users :-)
>
>
>>See you in Neuss
>I wish I could be there :-(

I'll try to make a report on this newsgroup.
>
>I would be great to see Atari back in the press for the right reasons.

The TV broadcasting of 10-6-2000 will be shown as AVI or another format
(if the WDR gives
permission) via Karsten Schaefer's site :
http://www.geocities.com/karsten_schaefer/milan_e.htm

Cheers
Dan
Milan 040 - Magic Milan

> Sounds like the same old Atari with Sam T calling the shots..Meanwhile
> the other guys are working on the fourth revisions..

nope, no Tramiels to screw things up.

Meanwhile, Mac OS-X is late again (as usual), they're promising
double-processor G4 systems without giving a firm release date (as
usual), and TiFKAS is still parrot-sheeping the Jobs part line without
having a single independant thought in his head (as usual)....

>
> A pipe dream!

and what has TiFKAS been smoking? He's claiming that Atari is dying,
and yet the success of the Milan project has him wibbling on and on in
full damage control mode.

In the meantime, there's been a lot of news on the software
development front. Papyrus Office is out NOW, and in an English version
to boot too! Tempus Office is out NOW. Word is that Milan's going to be
showing off a new CD-ROM recorder package at the launch, it'll be cool
if it turns out it's bundled with the computer....

hmm, interesting. Someone else has taken it upon them to take the
mantle of "Chunks" and and use it to bludgeon TiFKAS with. How
interesting, indeed.

BTW, TiFKAS, reason I haven't been replying as of late is that I've
been busy selling BBQs with the store. And I'm reaping the benefit.

Don't you have a mommy and daddy who gives a rat's ass about you? If
they did, they would install Net Nanny on your computer.

But then, I guess the Mac Community doesn't care about you,
either....

<snip>

ironic that TiFKAS is posting this mindless drivel as usual, while
at the same time MacAddict Magazine (a magazine TiFKAS hates because
they won't kiss Steve Jobs' ass) has posted some very really different
results when putting a G4 up against an Athlon 1GHz machine. Even they
were honest enough to admit that the Athlon was better at many of the
tasks in Photoshop than the G4, and it was only with the Velocity
Engine that the G4 had a slight edge over the Athlon.

MacAddict tells the truth. TiFKAS the prevaricator and useless troll
has been known to make things up from whole cloth. Who do we trust?

Oh, and speaking of which - it seems TiFKAS, who has crowed long and
loud about how "Newsreaders Are Obsolete!", is also a hypocrite. Looky
at what I found in the header of the message I'm replying to:

> Message-ID: <170420001556368481%sinclap@nospam.net>

^^^^^^^^^^^^^^^^^^^^

what's wrong, TiFKAS? Did Deja give you the old heave-ho because they found out you were using their service to scrawl your childish drivel on our walls? Or did it turn out that Deja was not as "perfect" as you thought? Or were you too cheap to register with Deja?

BTW, TiFKAS - YA NewsWatcher is now at version 5.0.1. What's wrong, can't your "superior" Mac run this program? :)

no, that you actually have an OPTION, pinhead! As it has been stated
in the Milan master plan, a Linux port has always been planned for the
Milan II. Compare this to the Mac, where Apple actively prevented BeOS
from developing a version of their software to run on G3/G4s. Jobs
afraid that Be would show up how bloated and buggy Mac OS 8/9 has become?

>
> > The 'Clap is a disease - and the truth is the cure.....
>
> Just stated a reason not to wait for vapor.

Milan II is not "vapour". The dual processor G4 tower Apple is
promising without setting a date for release is the epitome of vapour.

Oh, is the Milan II "vapour" because they set the date of release
back? Happens all the time in the industry. By TiFKAS' own yardsticks,
Mac OS-X - promised "this summer" and now set back - is the very epitome
of the definition of "vapour".

>
> > : Well a friend of mine contacted Suse about this, better

> choice but to be constantly behind. It's expected..

and, according to TiFKAS yardsticks, any '040 Mac is "junk".

Or, funny enough, the G3/G4 is now officially "yester-decade
technology"....

>

ahh, but they only ruled on 9 of the 11 charges. Which means the case
is still active.

but, of course, it all boils down to the fact that TiFKAS, who
claimed that Sony would be doing a licencing deal with Connectix RSN,
has failed in his prediction.

And the fact that Connectix must be losing money hand over fist - in
light of the fact that there are STILL stores stuck with the original
release, now selling them at fire-sale prices well below the MSRP, isn't
helping.

oh, and BTW, Bleem is now being officially sued by Sony.

ah, but it does. You see, I know Bruce. He's a knowledgable guy, and
he knows what he's talking about regarding his MIDI work and projects.
He's also a keen gearhead. He also knows who's acting like an ass and
who isn't

Compare this to TiFKAS, who has constantly had his ass handed back to
him on a platter with a side of mint sauce by pros like Particle Salad
and Brian Van Tilbourg whenever TiFKAS tried to bluff his way through
topics he knows absolutely nothing about.

TiFKAS will only start to have the smallest shred of credibility when
he reveals who employs him, who his supervisor is, and the number where
said supervisor can be reached. Or are you afarid the "Atari Jihads" are
"out to get you", COWARD?

The Hades runs Linux just fine except you must boot it from TOS in the
256 color mode. I hear that it is possible to change the video mode to
32k, 64k or 24-bit. I am looking into that now. I am wondering if the
Linux version for the Milan ii will be any different. I am thinking on
getting a Milan, but will wait to see how things go. The Hades is
serving me well and I am in now hurry to switch. But if I did, I would
still keep the Hades and use it mainly for Linux.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

TAF Home Page: http://taf.atari.org
Ken Macdonald, TAF President + Mario Becroft agent: 416-533-0504 or anarkist@idirect.com
Dan Dreibelbis, TAF Vice-President and Sinclap Tamer: 416-766-4743 or dreibel@idirect.com

So...Mac OS8/9 get the job done. I was hoping BEOS would take off on
the intel platform. From the looks of it...it has not..

Apple did not publicly show it..Was a private affair at a Developers
Conference...Big difference...Is that the best you can do?

> Oh, is the Milan II "vapour" because they set the date of release

It happens all the time? NOT!!!! Was true ten years ago..However, the
Tramiels gave the new meaning of vapor and has continued to do so
today..

Why the difficulty in releasing obsolete technology?

Mac X beta will be released to the public this summer...Most likely by
MacWorld..

Not the issue here..Ducking it I see. The whole package cost a $1 to
produce. Connectix would make money at $10..

> oh, and BTW, Bleem is now being officially sued by Sony.

So...

> stock....

First of, the reported drop off in iMac sales is not tanking. Were
talking upto 30,000 units in the 400,000 range..Plus the current line
has not been updated since last October. You failed to mention booming
sales of the G4, PB G3/2000 and iBook line.

Second, the web site is pathetic. No original content...just parroting
the others...Plus your no Rodney O' Lain!

Third, I sold the Corel Stock went it went to $40...sinclap is no
dummy..The only disadvantage is the capital gains..

Mac X beta will be out in summer time FREE!..Most likely at MacWorld..
Apple showed the double processor G4's to developers at a private
conference. Did not announce a time table but a technology preview.

Now name all the models and software that Apple has released in the
last year?

Now name all the models that the makers of Hades released in the last
year?

Sound fammiliar?

The 'formal' user group is as dead as Atari Corp - the remnant of the old 'user group' - all friends, users of Atari, Mac, and even PCs of various stripes - still meets once a month to chat about computers, software, politics and what have you.

The BBS is in the same place as the Dodo - extinct !

And I'll still not hold me breath awaiting the Milan on this side of the pond !

The Canadian Curmudgeon (in sunny Calgary, the downtown of which is a 'police state' this week, thanks to the eco-freaks)

5424. Apple crushed between a rock and the 'Clap

Newsgroup: comp.sys.atari.advocacy
Date: 2000-06-14 00:00:00 UTC
From: Chunks <noone@nunyabuzzwak.com>
Message-ID: <noone-1E0063.13010914062000@bigmomma.idirect.com>
Source record: 1689

What with the bad news about Corel, and confirmations that iMac sales are tanking badly around the world, here's another nail for the 'Clap's cofin, courtesy of As The Apple Turns.

Oh, and by the way, 'Clap, there's a propur definition for "vapor" here, unlike your "whatever I feel it means in my futille campaign to destroy Atari" mumblings:

It's one of life's sad little truths: when faced with a fork in the road, sometimes you make a choice you regret later. And as far as regrets go, Apple seems to have more than its fair share. There's the way they missed the chance to license the Mac OS before the whole world went Wintel. Then there's the way they licensed it too late and in such a brain-damaged, sales-cannibalizing manner. There's the years of development and millions of dollars poured into Copland before the project was scrapped. And most recently, there's the whole move to the G4 processor...

Okay, yeah, sure the G4 is one smokin' little chip. Gigaflops, and all that. Supercomputer performance. Whatever. There are a couple of serious problems, though, that are really starting to bite Apple in the behind. For one thing, that supercomputer-level performance really only kicks in when an application has been written specifically to take advantage of the G4's "Velocity Engine"-- and there are far fewer of those specialized apps than we'd like to see. And for another thing, there's this whole "stuck at 500 MHz" nonsense. We don't care how fast the G4 may in fact be; Apple's getting creamed at the Joe Shmoe marketing level, where Windows systems are available at twice Apple's fastest clock speed.

What really hurts, though, is that while Motorola is lagging with the G4, IBM is quietly cranking the G3 up to ridiculous new levels of performance. Velocity Engine aside, a 500 MHz G4 is reportedly roughly equivalent in speed to a 600 MHz G3. Well, guess what? According to The Register, IBM has just demoed its new 750CX and 750CXe G3 processors, which are expected to hit 700 MHz in the not-too-distant future. Which means it's entirely possible that the fastest G3 might soon be faster than the fastest G4-- and not just in terms of clock speed. (Yes, Motorola is supposed to have the G4 Max out by then, but we've officially adopted a policy of considering any Motorola processor to be vapor until it's actually shipping. That whole "G4 Speed Dump" fiasco was just too harsh a burn.)

So could Apple successfully switch back to G3s in its professional desktop Macs? Not likely; all that hype about the G4 being the future of computing was a textbook example of bridge-burning at its finest. To

"downgrade" from the G4 to the G3 would be a PR disaster of truly biblical proportions-- we're talking "ten plagues" kind of disaster. So no, we figure that Apple's going to have to keep its fingers crossed and hope that Motorola can crank the G4 up to the performance level it deserves. If everything stays on schedule (ha!), early next year we may have dual- and quad-processor G4 Max systems running the symmetrically-multiprocessing Mac OS X-- giving customers, say, "1.4 GHz" or even "2.8 GHz" Macs to play with. We hate the "Wait 'Til Next Year!" game as much as you do, but hey, if you've been following Apple for any length of time, you're used to it by now.

5425. TAF Flea Market June 21st

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

TAF Home Page: http://taf.atari.org
Ken Macdonald, TAF President + Mario Becroft agent: 416-533-0504 or anarkist@idirect.com
Dan Dreibelbis, TAF Vice-President and Sinclap Tamer: 416-766-4743 or dreibel@idirect.com

Irelevant stuff deleted....

You might want to rethink the iMac sales are tanking bit...

http://macosrumors.com/?view=recent

Supplies of current iMacs dwindling in preparation for speed-bump?

Several sources at national retailers including CompUSA, Sears, and the
The Wiz have all reported that Apple is either no longer shipping them
current-model iMacs, or that supplies are severely
constrained. Some locations could not confirm this, but it does appear
from quotes attributed to Apple reps that these stores are being told
to clear out inventory for a "late July" announcement of a new iMac.
As this is precisely the time frame for Macworld New York, the
reliability equation on this rumorappears to be steadily climbing
toward reality. Stay tuned for more details....

sinclap!

Perhaps you should take a look at the definition of Vaporware.... if it exists and has been released then its not vaporware, regardless of country.

Its kinda funny really - for some reason alot (not all) Yanks seem to think that the whole universe revolves around them :)

Matt.

> history..

I already have you some names, twinkie. I have a friend who has been making movies on a Targa 2000-based system for many
years.. VERY mid priced. Are you familiar with the Radius Edit DV?

> > "Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your

> > analog.."
>
> You'll get over it...

Very good, twinkie..

> Pro DV Cameras begin at $2500 for a nice Sony one...Prices are
> falling...

OH MY GOD! There is NOBODY in the industry who would say an XL1 or DVX-1000
is "PRO." NOBODY!! You keep doing it again
and again.. they are fine cameras, to be sure, for the price.. but NOT pro.

I know it's very painful for you to admit it, but you just don't understand
the business.

> > > What G4 problems?
> >

Give me his email addres and let me ask him.

Better yet, go here:
http://www.digidesign.com/ubb/Forum16/HTML/003225.html

..for a discussion on the problem, including a potential solution (a $700
dual monitor card).

Or here:

http://www.digidesign.com/ubb/Forum16/HTML/004153.html

..for a discussion on the problems with three monitors on an AGP G4,
including an admission from Digi that "it doesn't look good."

All it takes is a little bit of research, twinkie, to prevent making yourself

look more and more clueless.

> v 2 most likely will be ten times more..The beginning of the end of
> > > the traditional tools...
> >
> > Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid?

> > Man, you are
> > FUNNY!!
>
> Just wait and see!

Yep, I will.. it was, what, a year or so that FCP first shipped? Since then,

how many motion pictures were shot on DV and edited on a
FCP system? Er.. that would be none, right?

>
> > I don't deny that Avid has and will continue to change their business
model

> >
> > You don't have to believe me.. why don't you go to a video lab and ask
them
> > about it?
>
> Sure...

"Sure?!?" Does that mean you actually will do some research into the
industry?

Come on twinkie.. at least respond to the point above. Do you even know what

Radius' product is? Do you know what the
Casablanca system is? Do you know what a Targa 2000 is?

> > I'm sure you are.. you're trained in FCP, but NOT in the workings in the

> > something, when you
> > obviously don't. KNOW what you know. KNOW what you don't. It's a
valuable
> > skill.
>
> You should try your own thoughts...

Again, twinkie, I KNOW what I don't know.. I DON'T make prognostications about Apple because I don't really know the computer market very well, relatively speaking. I don't make any predictions about Adobe Photoshop or Quark or Microsoft Front Page or Apple's stock prospects or the prospects of OSX or..?!? You get it yet?

Stick with what you know, really.. I'm sure there are some areas where you are quite knowledgeable.. this ain't one of them, twinkie!

> > I don't buy from someone who is afraid to say "I don't know, I will check"

>
> True..It's the technique. Some have it many do not..I am in the many
> column hoping to get to the some column...Only if I can get the
> photgenic shot of my significant...

Right.. so, again, I have nothing to be "scared" about.. I'm in a no lose situation. I don't care what tool I use..it's just a tool.. as long as it's stable, I'll use it..

> > All the G4/FCP systems in the world aren't going to help you make good video
> > until you
> > know the above.
>
> True...But there are alot of young creative types out there..

Yes there are.. and there will be some great work coming out on these cheaper

systems. I've been excited about the digital
revolution in audio and video for a long time.. even though there's more crap

then ever before, the cheap technology also gives more
people the opportunity to do something great.

BUT..

Do you really think these young people with great ideas will stick with FCP
when they get more money? DO you really?

To say FCP is bringing about the demise of Avid is ill-informed, foolish,
Steve Jobs hyperbole that has no basis in reality.

You COULD make the argument that the digital revolution is causing Avid to
rework their strategy.. of course, it's causing ALL players
in the market to do that, but at least that would have some truth to it.

So really.. to put it honestly, your ridiculous parroting of the Apple PR
"reality distortion" line just serves to make you sound like a
stooge. I really believe you're smarter than that.. against all proof,
maybe, but I believe it. Act like it..

> Very True..That was covered in the video media production class. But
> there are lots of creative types out there that can figure out unlike a
> certain 'chunk's'...
>
> > Who will win? I don't know..
> >
> > All your silly predictions are meaningless.. of course, so are mine,
except
> > that I, at
> > least, realize it.
>
> The tone in your post does not indicate this..

Right.. but if you're going to invest in a company, would you listen to your
grammy who spends 15 minutes a day on etrade and does
no research over someone who spends full-time looking, researching, checking
out the market? Wouldn't it seem rather ridiculous
to hear your grammy comment about something she knows nothing about?

Your comments are so far off and display such an incredible lack of
understanding of the market, yet spoken with such certainty, that
they need to be debunked clearly and often. This is not about any 'tone' of
my voice.. YOU set the tone with your ridiculous post. Do I
need to repost it? Oh what the hell, let's just look at the headline of this

thread:

"The new products with the PM G4 and final Cut Pro could be the final nail in

Avid's coffin.."

Is that clear enough for you? WHO among us has actually admitted their limitations in this thread? Me. Who is clear about the reach of their knowledge? Me. You've displayed zero understanding of the limits of your knowledge. Zero.

> > Don't look now.. but once again, you tried to bring the ball inside on me.
> > This time,
> > you didn't even get a chance to try a shot before I picked you clean, then slammed it
> > over your head.. are you foolish enough to try again?
>
> Than why are you sweating?

Because I'm laughing so hard, I can't believe you would try yet AGAIN to score on me. As a matter of fact, I'm laughing so hard I've gone into convulsions, and I'm sweating profusely.. yet even through the convulsions, I'm STILL able to stick my arm up and grab the rebound on your badly missed shot.

Well, it had to come to an end someday... I have to sell my old Atari stuff to make room for other stuff.. :(Fortunately, my Atari will still live on through emulation on my iMac, but emulation ain't perfect.

Anyway, below is a list of what I'm selling. Right now I am asking $250+shipping for all of it. I will consider breaking it up if I can't find a buyer for the entire package. I want to sell to someone who will take care of this stuff and appreciate it the way I did. Reply to this in email if you're interested!

Original Software:
Phasar 3.0 - original box/manuals
Timeworks WordWriter 2.0 - original box/manuals
PC-DItto 3.0
GFA Basic
1st-Word
DB Master One/Megaroids
Space Harrier
Metro Cross
Epyx World Games
Epyx Battleship
Top Gun
Harrier Combat Simulator
12 Computer/Atari ST User/STart! disks

Books:
GFA BASIC
GFA BASIC Training Reboot Camp
Atari ST Internals
1001 Things To Do With Your Atari ST

Hardware:
1 1040STe - 2 megs, TOS 1.4 or 1.6
1 520ST - Half-meg, TOS 1.0 or 1.2
2 SF314 Double-sided double-density drives
1 SC1224 Color monitor
1 Beetle Mouse - may not work
1 Atari standard mouse
(the CPUs, disk drive, and Beetle mouse all come in their original boxes and have the original documentation, as well)

Magazines:
3 Issues of Current Notes (Apr, Oct, Nov 93)
1 AtariUser (Apr 92)
2 Atari Advantage (May, Oct 92)

1 Atari ST Informer (Dec 92)
1 Atari Interface Magazine (May, Fall 92)

PD/Shareware Library:
168 PD/Shareware disks
All programs are archived
Each disk is categorized (Productivity, Communications, Games, etc)
15 Magazine cover disks
The library includes one set of master disks, and then anywhere from 1-3 copies of each disk
The library also includes two bound catalogs
One lists all files in alphabetical order with the disk number they appear on
One lists all the files by disk number order

If all else fails, try an see if you ghostscript supports that
printer and if you could adapt it's source to your needs.

Ghostscript is a Unix oriented package that is meant to make any printer appear to
be a postscript printer. Part of it is a collection of postscript -> printer translators
for a wide
range of printers. There is even an Atari version but I don't know how current it is.

It is essentially a printer driver package for Unix systems, most notably Linux. If your
printer is old enough, I suppose the Atari version of Ghostscript would support it.

It's available as source code, so anyone that needs to could cannabalize it for use on
another operating system.

5441. Sony Re-Files its Connectix case - PSYCH!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-07-06 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-DFF31C.21495605072000@bigmomma.idirect.com>
Source record: 1606

So The iDiot Forever Known As Sinclap was rejoicing over the fact that Connectix has supposedly prevailed over Sony in the infamous Virtual Game Station case - and had thought that it had meant a major death blow to me.

Well, it turns out that as he and Connectix did their little jig of joy, the bear, which was not quite dead, turned around and swatted them upside their heads.

In other words, Sony has re-filed all of its patent infringment charges against Connectix in court, and in such a way that this time they will stick. It also turns out that in pulling out those charges that there were still two that were on the table - which means that THE CASE WAS NOT AS DEAD AS TiFKAS THOUGHT IT WAS.

It's a real sad time to be TiFKAS right now - his Corel stock has shot through the floor, the iMac has disappeared off the radar screen regarding sales, the non-vapour Milan II is going ahead with development with more and more developers in Germany jumping on the bandwagon, his support for Mike Harris as a weapon now faltering since Mike's Uncommon Nonsense Revolution has come off the rails thanks to the events in Walkerton, and Particle Salad and Brian Van Tilbourg have continued to give what little is left of TiFKAS' butt a solid kicking using the one thing that TiFKAS really hates - the truth.

As for me - doing quite well, here in what the United Nations have once again, for the seventh year in a row, called the Number One best nation to live in on earth for quality of life. Indeed, life has been so sweet as of late that I've decided to take a much-deserved vacation in less than two weeks.

The place - New York City.

The event - MacWorld Expo.

Yes, that's right, MacWorld Expo. I read about the free tickets to the exhibition there and applied, and got one.

Which means that there's a good chance that I'll be coming face to face with TiFKAS himself at the Expo, after all, the little weinerhead has always bragged and bragged about all the Apple-related exhibitions he goes to in his fantasy that he's an "Apple Power Rep".

And you know, if I do see him, you know what I'm going to do?

I'm going to laugh in his face :) And then maybe I'll buy him lunch :)

Maybe even take photos of him, and post them here - I'm sure we're all dying to know what an Internet troll actually looks like in the flesh.

Oh Christ! I've just eaten lunch Dan! Did you need to say that? The very thought makes my stomach do hulahoops! Cindy Crawford (and maybe Milla Jovovich!) but NOT sinplop! The internet doesn't deserve (or need) that!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ Falcon030 owner.

PS. The lunch offering is a nice idea! Sinplop might need a little energy to face the reality!

5443. Warning! -- SONY SUBSTANDARD SERVICE

Newsgroup: comp.sys.atari.advocacy

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!

I sold the Corel at the highs..sinclap made a handsome return oly to be eaten by capital gains since I held it for less than a year.

The iMacs have done well according to press reports, that inventory is pretty much flushed out of the channel.

> As for me - doing quite well, here in what the United Nations have

I bought an Atari Lynx last week. It's a nice piece of work, leaves the gameboy for dead but...

Then I read it was designed by two of the original Amiga design team.

That explains why it's cool, despite the Atari logo.

Ok, consider this a wake-up call - or is this group dead?

:-)

On a more serious note, how is the Milan II situation going?

Regards,

Clockmeister

The reason is that I have two kids and little hands love to break things.
They do not touch my original Lynx, but the Lynx II is fair game.

I think you might mean an adapter which allowed us to play Lynx games on
TV. I though that was done and would be selling for around $200. I thought
Wizztronics was putting that together.

Naturally, because 3 is an odd number. Out of curiosity, why would you want more then two? (given that two units can be linked for multiplayer games)

I distinctly remember a TV adaptor (not modulator, which did exist)being advertised here in Australia. It allowed TV to be watched on the Lynx. I know this to be technically impossible given the relatively low resolution of the LCD, and apparantly such a device never made it to market. Must have been bogus advertising presumably.

i have watched you with humor slamming atari, when apple was just barly able to stem off the gatesopoly who vowed pc or else.
apple got lucky with the return of jobs who would not back down, and our stupid, and always to late to the draw government helped apple turn around, but they are not clear by any means.
the super rich never give up.
anyways i plan on buyng a milan II when it becomes availible.
i live in mn. and i go to comp u.s.a.'s all of the time, maybe we will meet someday.
my son bought a g-4 mac there, i wanted him to own something non pc, he started out on a atari 130xe.
he likes the g-4, but like me he also understands that apple cannot do this on there own, and heathy minor competitors from the atari, and commodore era well help expose the average user of computers that there are alternatives including apple.
you should be happy for all non pc users that we have alternatives.
apple cannot be every where, and having 2 more minor players can only help the average person who usually is just above the dim whit stage to question the powers that be if they happen to stumble upon a non pc computer that really is a computer that works,
thanks,
lance

No, this ad clearly displayed a TV addon gadget with a telescopic antenna
and tuning dial. It even showed a TV picture on the screen, but that didn't
look real. It must have been a vapour product.

I need more then a colourfull box to convince me though. I don't want to be stuck having to drive for miles to check out some software titles and having a limited range. Nor do I want to use a lame OS.
I could run Linux, but I can do that on a PC for half the price - and better.

Apple have carved themselves a niche market - The iMac for the newbie/bubblegum brigade and the G4 workstations for graphical workstations and such.

Neither of those niches are relevant to me, so the PC is a far better solution at this time.

Boy, they blew it big time..

Once again, they forget about the professional audio or video user who needs six PCI slots..

The cube? Great idea.. IF they made an optional 6-slot PCI expander. They don't. Stupid. No fan.. what could be better in a recording studio, right? Except.. THERE'S NO PCI SLOT for your pro audio card.

Oh, you'd like to hook up your CD player to the cube and record? Sorry.. there's no audio inputs and outputs either, though we'll throw in a USB speaker system.. I hope you like the way it sounds. Of course, it doesn't matter how it sounds, because it LOOKS COOL. Real smart.

They couldn't get enough faster G4 chips, so they release dual processor Macs.. nevermind that no current applications or operating systems can take full advantage of them. Very few apps can make ANY use of that 2nd processor.

Oh, by the way, you like our new multiprocessor G4? You have to buy a NEW Apple monitor to do with it. You already have a nice monitor that you bought from us last month? Sorry, maybe someone will release an adapter.. there are none available right now.

Believe it or not, there are many video professionals in the world who like to CHOOSE their own compression codec, and NOT be limited to the 5:1 compression of DV. THEY NEED PCI SLOTS TO PUT VIDEO CARDS IN!!

Apple is now a consumer products company, not a company who is building machines for professionals. Yes, Macs do meet the needs for some design professionals, I agree, for the most part.. but FORGET about audio, video, and multimedia professionals. Maybe that's smart.. sure there's not as much money as there is in building pretty imacs. BUT.. if you want to be the company that "thinks different(ly)," give creative professionals the tools they need to get the job done! Damn, I'm glad I kept my 9500.

So rah-rah back under the rock named Steve Jobs you're hiding under. Unfortunately, the rest of us can still see what's going on in the world.

Actually, the sorts of 'power' you are talking about
is strictly restricted to PDA's and embedded controllers.

There are PDA's with as much RAM and more powerful CPU's
than the little system you just described.

Also, I wouldn't be surprised if those PDA's have more
rendering potential in their CPU's than a Riva128 would.

A fellow MN here...-)

According to the financial types on Wall Street, Apple is out of it's
turnaround mode and is now on the growth mode. Just signed up Circuit
City, the Whiz and Wolf Camera.

Commodore and Atari are out of business so they are not healthy minor
competitors. Many of the users have moved on such as yourself.

Apple is almost everywhere but will not over extend last time. The
Cube has drawn a lot of enthusiasim in the retail scheme of things.

Will be in CUSA locally for the week and IA next week.

If you think about it, do you think the Milan040 is anything but an Atari crust pie with PC filling? Not me. I'm talking about bringing back the Atari TYPE! All-in-one design. Maybe even the styling, like the original 520/1040ST or Mega ST's. Besides, if you want to talk about speed, the Milan040 processore is equivilant to the i486! Of course there are more powerful systems out there today, but power is NOT everything... preference is! Why do you think some people are still using their ST's and Falcon030 or other ST-clone systems... because they LOVE them! That's what makes a loyalist...

You are one who has moved on to another system/OS and left the past dead, accepting fate as unchangable and have no desire to try and see if the dead can be reborn. We need you not!

They're not competitors at all! But if people would get off their duffs and help make this dream of Atari's rebirth possible, the name Atari could be at least as powerful as Be! I want to help put Atari where is SHOULD/COULD have been, not where it ended up thanks to the Tramiels.

By the way, after JTS went under, where did those low-lifes (the Trams) go? Where are they now? I'd like to kick them in the head for what they did to my favorite company.

Now - that - would be a helluva machine - updated TOS in ROM - with at least 32 meg of Ram, a 4 gig hard drive, flat panel display, and a couple of USB ports - and able to use well designed Atari 'no bloat' software like Pagestream, That's Write, Papyrus and so on - I'd buy in a flash !

And, I'll still not hold me breath !

The Canadian Curmudgeon (still using a steam age computing engine, the Mega/STE, in sunny Calgary)

4% or so of a market is only hanging on by a thread.
they are coming out with some cool stuff, but they cannot do it all by themselves, they need other platforms also to genrerate non pc software houses who will write real software that takes advantage of real architicture, so that the average user can really see/appreciate what a real computer can do, not bloated pc port overs.
and although atari, and commodore are out of bussiness, what i mean is there platforms.
many cool small companies went out of bussiness that wrote software for non pc platforms, and they survived by writing software for more than one platform, thus giving all a wealth of choices that you do not see in the modern pc driven stores, only bloated bug ridden stuff you see today.
i run my bussiness on atari 8-bit computers, i have a data base of over 10,000 customers, and many 1000's of items, all on cool software written many years before the pc could even do it.
i use a mega st for games, and desktop publishing.
i will use the milan for the net.

A rather small subset of the userbase.

[deletia]

--
Unless you've got the engineering process to match a DEC,
you won't produce a VMS.

You'll just end up with the likes of NT.

>
> The Photoshop plug in will keep the users happy until the other guys
> optimize the apps for the Dual processors..Next

Yea, just like when they released the multiprocessor 9500 180MP.. TONS of dual
processor apps coded.. NOT.

Still, there are many applications that do not use Altivec too. Apple is making
developers once again redo their code.. OR wait for OSX to redo their code
once. What do you think they are going to do? Right, redo their code once.
It's stupid to release a multiprocessor machine without apps that will take full
advantage of it.

> > Oh, by the way, you like our new multiprocessor G4? You have to buy a NEW

Er.. you DID know I wasn't talking about the cube, didn't you twinkie? The NEW multiprocessor G4s.. do they have both VGA and the new connector?

> > Believe it or not, there are many video professionals in the world who
> > like to CHOOSE their own compression codec, and NOT be limited to the 5:1
> > compression of DV. THEY NEED PCI SLOTS TO PUT VIDEO CARDS IN!!
>
> Then get the G4 Tower...

Er.. twinkie, one more time, do the math:

agp slot: video card 1
pci slot 1: video card 2
pci slot 2: SCSI card
pci slot 3: video card

Where do I put my pro audio card? Where do I put my 'ice' card for Media Cleaner?

Or for the audio workstation, where do I put my dsp farms?

DON'T even talk about capturing to firewire or to the internal IDE. Internal IDE drives might be fast enough, but there are no IDE DLT drives for backup, so I need SCSI anyway... and firewire drives are not currently anywhere near fast enough for uncompressed video.

> > Apple is now a consumer products company, not a company who is building

I am going to construct a website dedicated to the rebirth of Atari and the computers it made (and will make, if I and others have anything to say about it!). I'll report when it's ready to visit.

Who would buy this new reborn Atari box at these obsolete specs? The
new box would have to attract new users to prosper instead of living
off its dwindling base. Apple knew this, thats why the iMac was born.
Bringing new users to the platform. The new $799 iMac will continue to
drive the userbase and marketshare. I do not see the Atari box doing
anything..

Apple's consumer marketshare is increasing and will double soon by next year now that another retailer is on board...Circuit City with 550 stores. At MacWorld NY, there was hardly any spare floor space. Lots of small developers were there showing their wares. Apple's foucus is retail with iMac and iMovie II.

I never said it wouldn't sell. I said, once again twinkie, that Apple has neglected audio and video professionals. I said, the cube could have been a solution. I said, Apple is now just a consumer hardware and software company. I said they could have had a KILLER machine that would make a lot of people happy. Instead, they have good machine that will make some people happy. I suppose that's good enough for twinkies like you and Jobs.

Man, you are an imbecile. I, and most audio/video professionals, need more than 6 pci slots. Clear enough for you?

> > Yea, just like when they released the multiprocessor 9500 180MP.. TONS of dual
> > processor apps coded.. NOT.

Oh yea, the new Apple.. the one that releases new technologies way before they're ready..

> If you don't release a dual processor machine then the apps will not be
> written. Next.

Er.. imbecile alert again. If they release an OS that takes advantage of dual processor at the same time they release dual processor machines, THAT makes sense. It makes NO sense for Apple to release these machines before then.

Imbecile alert III. Slots two and three are already filled, twinkie.

> > Or for the audio workstation, where do I put my dsp farms?
>
> A PCI expansion box. Next

Right.. but ask about how much luck people have had with expansion boxes on Digi's board. Ask if they can put a video card there.. or a SCSI card.. or some other card. It's hit or miss.. it's a kludge, twinkie.

> > DON'T even talk about capturing to firewire or to the internal IDE. Internal

"Yea, right?!?" That's the Sinclap moron response when there's a point you cannot refute. Firewire drives are NOT fast enough. What is the fastest currently shipping firewire drive? Do a little research and get back to me.

Message-ID: <lwji5.231$no2.18604@news.goodnet.com>
Source record: 1553

Ok, it would appear that a lot of the people replying to this plan are doubters that such an idea is even sane, not to mention even remotely desirable. But I ask you this... have you "given up the ghost" because you feel that we as end-users/enthusiasts/developers have NO power above and beyond the corporate structure?

This isn't the case, as many believe. Money oft talks louder than screaming, amazing as that seems. And we all have money, regardless how much or how little. We need it to deal in this world. So, this concludes that we:

1) Can do something about reversing Atari's demise.
2) We have financial resources with which to do that reversal.

And what if you haven't "disposable income" with which to aid? Are you a programmer/developer? Are you a good pitch person, able to rally the troops? Everyone in the Atari camp CAN help, one way or another. There's no excuse, except your own belief that we, as users, can't possibly change anything. That history (and the actions of the idiot Tramiels) is unchangable, so we just have to adapt or move on. And that's wrong!

I present a question...

Does anyone know how much Atari was bought for by Hasbro? Was it $5 million? $10 million? $20 million?

This is where things begin...

Luposian

I present to you an even more important question:

Why are you not already importing Milan and Hades by the dozen?
Why are you not helping Rodolphe develop his Phenix and Rio Red?
Why are you not putting your money where your mouth is?

THIS is where the Atari of nowadays begins.

You're talking of working with this present situation. I refuse to do that. I refuse to accept the death of Atari as absolute. I refuse to accept that the best we can have are the lesser clones of the Falcon or whatever. I refuse to believe that we can't possible change what was done if we simply team together towards a common goal and try hard enough.

Besides, I have absolutely NO disposable income, nor will I, for the forseeable future. Credit cards and married life have taken my thousands and made them required for supporting a family. So, how do you propose I do of which you speak? Rob a bank?

How can you call them "lesser" if you never tried them?

_I_ have tried both the Hades and Milan. I _know_ they are very
good machines and every bit in the Atari tradition, even up to
what kind of "bugs" or limitations they show.

You apparently have no clue what you are talking about. You are
just cluelessly reminescing the "good ol' days of the ST."

According to a gaming magazine I just read, Hasbro *ONLY* paid $5 million for Atari's entirety. This now means that a buy back is NOT outside the realm of possibility. Afterall, the computer devision surely is only one small fragment of the whole, no?

I'm not kidding. That's what it said! I'd scan it in and show you, but haven't a scanner these days. As far as the rest of what I said, I'm making an assumption that the computer division would be but a small part of everything that Hasbro owns of Atari.

No-one is going to want to flog such a dead horse.
Not only that, all that remains of Atari is the name - there is no "computer division".

I do not think Jared means lesser quality. I am sure even he understands
that a 68060 computer is better than a 68000 computer. Lesser means not
having the Atari name on it.

Sure, there could be an Atari computer division but not flogging Falcon based technology which for the masses _is_ dead. That would include Milan and Hades, although if brought up to speed with current technology there would be a reasonable chance of finding a some mass appeal.

Ofcourse, that doesn't mean the current stuff is worthless or useless to the Atari fans. (Unlike older PC and Mac junk)

You're dreaming. Hasbro has added their own value to that pricetag;
further, they would have to be convinced to sell it at all. If they
were agreeable, it would cost a hell of a lot more than $5M, but I
guarantee they would not be agreeable to you, since I'm guessing you
don't have that kind of money anyway.

> Afterall, the computer devision surely is only one
> small fragment of the whole, no?

Computer division? What computer division? Hasbro bought the Atari
name and its properties - there are no "divisions" of any kind.

That's rather disputable actually.

If anything I think they've managed to devalue the Atari name.

[deletia]

Of course Hasbro might have different ideas regarding the
value of the trademark.

That's melodrama. They have product and inventory, not to mention
properties that are seeing a resurgence in popularity.

> Of course Hasbro might have different ideas regarding the
> value of the trademark.

That's exactly my point. Besides, the property is a viable means of
future income. Why would they even be interested in selling?

Atari is gone. Anything that comes along to restart it will resemble
the original Atari in name only. I understand nostalgia - get it all
the time myself - but I don't understand the futile attempts at building
virtual time machines.

Mike

5505. Bush Sucks, Vote GREEN

Newsgroup: comp.sys.atari.advocacy
Date: 2000-08-05 00:00:00 UTC
From: Susan Collins <senator@collins.senate.gov>
Message-ID: <wfocQWCCAmevtk@news.senate.gov>
Source record: 1570
Cross-posted to: japan.test,comp.sys.atari.advocacy

5 Aug 2000 23:31:57 GMT

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Old news. URL to a US government web site that keeps tracks of
all trademark changes was posted here, back when Hasbro bought.
Raw details of exactly what was included in the deal were found
in that document.

In any case, Hasbro wanted Atari only for the fame attached to
the name and to ride the "back to classics" wave by resurecting
Frogger and Centipede in 3D using the Atari name.

I just read that Atari Games (owned by Midway/Williams) is no more and that Hasbro may have been the force behind it. If that's true, it may very well be unlikely I can achieve my dream, since this would seemingly indicate they want only one "Atari" for their own purposes. *sigh*

People want their TOS computers, right? They want their slots, right? They want it all, right? Well, so do we!

What if (the new Atari) computers were simply modified PCs? You alter the BIOS a little, to allow for an Atari splash screen. You have an Atari ST emulator that boots first, unless you press a certain key to go into GEM2000! And since GEM was originally written for a PC, can you imagine how fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not to mention a Pentium II/III, if optimized? Yee-haw!

Sure, you could more or less do that already with a PC today, but assuming anyone cared about the BRANDNAME (unlike most people here, it seems), it still wouldn't be the same.

We would have affordable, already-made PCBs with all the slots you want. We modify drivers to work with GEM for the cards we install and... whoo-hoo! We've got Atari computers again, more affordable than EVER, because parts are already available and cheap!

The only thing we need to do is modify: the BIOS, an Atari ST emulator to work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!) on a Pentium-class computer! In fact, if we played our cards right, people might ACTUALLY be able to run their apps on both the ST emulator and the new GEM! But we HAVE to rewrite as much as possible to optimize it for today's PC environment!

Sure sounds feasible to me and a LOT cheaper than trying to build a custom 060 or PowerPC board, plus modify the emulator and GEM to all that stuff. Not to mention the drivers... oy!

Now see what you clone-people have done? You've taken me from my grand classic Atari ST designs to this altered plan where there's very little difference between a new Atari and a standard PC! All in the interest of finding some way of getting Atari back!

I gotta get some sleep... stuff to dream about! Yeah!

What income?

It's not clear that such a crusty trademark gets them anywhere.
What Atari means to the general public and what it means to a
few Nostalgists or Zealots is entirely different.

[deletia]

A net gain for Hasbro has not been established.

Please stop cross-posting this thread to every atari newsgroup.

Since you are talking about some souped up ST clone, post only to
the comp.sys.atari.st newsgroup, in the future.

Otherwise, if you still wanna pursue the "with the Atari logo on
it" crusade, use comp.sys.atari.advocacy, instead.

If you are gonna insist upon caling it american-made, instead of
having a global perspective, please use alt.buy.american.

In any case, stop poluting the newsgroup with your nonsense.

If you really want to revive the platform, start by visiting
every page referenced on:

Hallvard's Launchpad http://atari.nvg.org/launchpad/index.html
The Atari Webring http://www.webring.org/cgi-bin/webring?ring=atari;list

In other words, do your homeworks first and research the current
market, if you wanna be taken seriously.

It doesn't matter. It's product and inventory. Emotional attachments
have nothing to do with it.

This has nothing to do with emotional attachments.

That's rather the point. No one with POSITIVE emotional attachment
associated with those marks care about some bad clone of a cherished
original.

To anyone else, the marks are pretty much meaningless.

As far as 'inventory' goes: it's only worth as much as people
are willing to spend for it and it's not clear that those marks
enhance the value of that inventory.

No! What's sad is that MONEY is the motivation for a lot of companies today. Customer relations seem not to be a high priority that make as much money as quick as possible, even more than you need.

So when you put MONEY before PEOPLE, it is a very SAD day! and it does look like the world is that way orientated.

While the Common Market (called the EEC, due to everyone liking initials) have mountains of food rotting, there are millions of people in need of food and are dying of starvation.

Hasbro seem to be buying everything they can get their hands on.

5517. CONSUMER ALERT - Beware of Eucalypt Software - Makers of Autopost & Rocketfuel!!!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-08-20 00:00:00 UTC
From: Warning-Warning@hsfwm.net
Message-ID: <6086A3EE8EEE280.ddmlsdtmf@adew.net>
Source record: 1582

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.
-

I've heard the annual sale and swap meeting of the Columbus,
Ohio, Atari club will be taking place on Saturday, September 9th.
Here are some details I've heard about this event:

Time: 9 am to 3 pm (Eastern Daylight Time)

Place: Oakland Park Community Center, 980 Lenore Street.

Location: Use East North Broadway or Cooke Road exits of I-71,
northeast side of Columbus.

Admission: $4 per person. (Maximum $8 per family.)

All you need is a standard 25-pin DIN cable, IIRC male to male (plug to
plug).

These are dead cheap and are available from most GOOD computer and
electronic stockists. In the UK they are around ï¿½7 GBP.

I guess I'm in La-La Land too, I still enjoy using Cyberpaint 2 instead of most of the crap made for the PC. Take a 486DX2-66 or 80MHz computer can try doing some of the stuff that can be accomplished with a Milan or Hades060....you'll be waiting awhile...Oh and you'll need that 20GB hard drive and 128MB of RAM that CompUSA has on sale to do it on the PC.

>on N64, only cause you cant get Jag stuff in Australia. So if you want to
>play games get an N64 and a Falcon/Milan and leave the crappy PC's
alone....
>

Rendering on an '060 is slow, as is encoding/decoding MP3's, oh and my webcam won't work on that Atari/clone, or my scanner or my printer for that manner. I like to surf the web and get the full internet experience, with full plugin support.
I kinda got used to going to a local shop for my hardware/software purchases too...

Then again, my PC is over three years old (P233MMX) so I must be overdue for an upgrade which luckily for me won't cost me much, and should keep me going for another three years.

Seriously though, I still amuse myself with my Amigas but to suggest that they can compare to modern PC hardware and software would be rediculous. The situation is even worse for Atari and clones.

Regards,

Clockmeister.

It should if you load up Linux on it. Given that, there's really
no good reason that you couldn't scan, and print and frame grab
to your hearts delight.

While rendering may be slower, that shouldn't be too much of a problem
as you can just leave that in the background as a batch job.

>manner. I like to surf the web and get the full internet experience, with
>full plugin support.

So, are you going to suggest the assinine and proclaim that we should
all be using WinDOS and Exploder to browse the web? (and for computer
use in general)

[deletia]

Personally, I find a computing experience limited to just that to
be highly depressing...

>too...

I guess it all depends what you call slow. I have rendered things before
and I thought it went pretty fast. What kind of scanner and printer do you
have?? No problemo with my Epson Photo printer or my Microtek E3 scanner.
My wife has a HP 2100 laser printer and my Hades/NVDI run it just fine.
WebCam will not work on Hades/clone that is true because no driver exists.
I would agree that if such a driver exists, it would be slow. Still, I
would love to give it a try.

>Seriously though, I still amuse myself with my Amigas but to suggest that

For the most part I agree, but then I disagree. Programs like Calamus
compare very well to most DTP programs that exist for the PC. I am still
happy with my computer and would not switch for any reason...

Then what's this BULLSHIT about "full plugin support". The only
OS variant that can ensure that is WinDOS & quite possibly only
WinDOS+Exploder.

The number of available plugins for Linux, BeOS or QNX is miniscule.
```

>
>Depending on what your specific needs are, the benefits may not outweigh the

Windows is kind of an extension of Bill's personality ;-)
I haven't bothered to customize Windows because to me it only serves as a
tool for doing some of the things that I like to do, and that aren't
available (or as well supported) on other OS's/platforms.
I like my Amiga (and other PC OS's) for customizing and tinkering, it's
just more fun...

Regards,

Clockmeister.

There are more Kiwi's living in Australia then there are in NZ I reckon.
There is _something_ they like about this strange land, like our job
oppertunities for instance.

Regards,

Clockmeister.

Tired of all dat crap dat phony Apple salesapologist Sinclap's been shovellin' down Atari users throats all summer? Well, a long-time poisson in the Atari world has some very interestin' things to say about processor speeds and bloated, buggy operatin' systems like Windows ME and Apple's seven-years-too-late OSuX - and how both companies bamboozle yas into thinkin' old computers are useless and junk.

Oh, yeah, and for all dose here who moan, "what's dis have ta do with Atari Computers?". Keeps readins, mine fronds, 'cause he mentions Atari and dere users in the missive......

Come to our booth at Comdex and you won't be disappointed. But let's cut through the marketing hype. The following is an open letter to all Emulators customers and Macintosh users from Emulators company founder Darek Mihocka. The original letter posted on September 15 is immediately below. Part 2 posted on September 21 and 23 is below it.

September 15 2000

Since our demo at Macworld Expo in New York this past July, we've been getting inquiries about when exactly we'll be releasing SoftMac Professional, the Power Macintosh emulator that was demoed at that show, and when we'll be supporting Mac OS X. I would like to answer those question right now - NOT ANYTIME SOON! Please don't send yet another email asking when. We will show our Power Macintosh emulator again at COMDEX as mentioned above, and in January we'll be returning to MACWORLD San Francisco again to demonstrate it there. As of today, we do not have a release date set, and we are shelving further development on the whole SoftMac Professional PowerPC product until next summer.

I would like to clear up some confusion and rumors and respond to a number of general questions we've received by email. Is Emulators Inc closing down? Not at all. As I will explain, we are putting work on PowerPC emulation on the back burner right now and focusing on other products and technologies for the foreseeable future. PowerPC emulation is a nice idea, a pretty cool idea in an ideal world, but from a business point of view the time is not right, and the whole Mac OS X thing just goes against everything my company stands for. The Power Mac emulator is not a product that fits our goals right now.

Emulators is in business to make emulators. I personally have been developing emulators for over 14 years now and have always believed in the concept of one computer that "runs it all". This nonsense about "my computer is better than your computer" that raged through the 80's and still lives on today is just counter productive and wasteful. In reality, let's face it, all the people that build and design computers

came from the same engineering schools, learned the same technology, and pretty much build the same computers. An Apple Power Macintosh G4 and an Intel Pentium III based computer really have far more in common than most people would like to admit. That's what makes emulation plausible - an emulator simply does some translation of one type of computer code to another in order to make machine A run software written for machine B. I believed in this concept 14 years when most people said it couldn't even be done, and I see today emulation is highly popular, with products such as Soft Windows and Virtual PC and of course our own Fusion and SoftMac 2000, and with major operating system such as Windows and Mac OS 9 using emulation to run older software. Most people don't realize that without emulation Windows 98 and Mac OS 9 would grind to a halt since most of the code they run is actually legacy code written for older operating systems.

So it's with some enthusiasm that about a year ago we embarked on the major task of developing a PowerPC emulator to run new versions of Mac OS on the PC, including the upcoming Mac OS X. Unfortunately we fell victim to our own hype and other people's hype, believing Microsoft about the capabilities and schedules for new versions of Windows, believing Apple's claims about Mac OS X being available this summer, and believing AMD's and Intel's claims about new gigahertz class processors. We got the PowerPC emulation working in the lab this spring, it worked as expected, and we planned to ship a product later this year. But we fell for too much hype from the other guys without really paying attention to what customers were asking for and thinking about what really made sense.

As anyone who reads the news knows, it's been a busy month so far for hardware and software. Intel was set to release their gigahertz Pentium III but had to recall the product due to the fact that the chip, well, didn't work! Oops. The Pentium 4, the first major change in Intel's processor architecture in over 5 years, well, that's a bit behind too now. Anyone who has read the current issue of Popular Science magazine has likely seen the article about the Pentium 4. It says by the time you read the article the chip will be out. Oops! AMD, well, they make great chips, excellent chips that we highly recommend, but their capacity alone can't fill the void in the high end chip market right now. Intel's Itanium chip, the new 64-bit processor replacing the Pentium line, is years behind schedule and has now been pushed out into late next year.

The availability of these chips is crucial to making a real-time G3/G4 emulator work well. While 68000 and 68040 emulation may work beautifully on 100 MHz to 500 MHz class PCs, emulating PowerPC chips, simply due to the nature of the much faster clock speeds of the PowerPC chips compared to 68040 chips, requires faster PCs. All the hype from Intel and AMD about low cost gigahertz class machines being on our desktops today just hasn't panned out. Sure, as a company with deep pockets, we can afford to buy the rare few machines and blow $6000 a pop on Windows 2000 machines to demonstrate our product on at computer shows, but this is not realistic as far as our customers go. Most of you are not running

600 800 1000 MHz class machines, you're running 200 300 400 MHz Windows 95 and Windows 98 machines. We can put on a great demo of our product at Macworld for you, but is this the experience many of you will have at home on your PC? No. As many of us that have run certain emulators know, a slow emulator is next to useless. Who hasn't run a PC emulator on a Mac only to be disappointed by the excruciatingly slow performance? This is not acceptable to us and is not the kind of emulator we want to market. While we take great care to hand code our emulators in assembly language, not C++ or some other bloated language, there are still limits to how fast an emulator can be. Obviously a 200 MHz PC can't hope to match the speed of a G4 under any circumstance.

We all have to stop and realize something, a point I keep reminding people of when they email me and ask about PowerPC emulation. The kind of customers looking to upgrade from an old Mac to a PC and who buys our 68040 emulator products is not the same kind of customer who'll be looking to run Mac OS X on a G4 emulator. It's two entirely different markets consisting of two entirely different kinds of computer users. For most of the past 14 years our products have catered to the first kind of customer - someone with an older computer, say a Mac Classic or a Mac II, looking to upgrade to a new computer, say a Pentium running Windows 95, and who wants to just make that old software run. This kind of user is on a fixed budget, who isn't interested in throwing away 10 years worth of old software that they love and enjoy, and who can't afford to buy new every year. This is the kind of customer that got our business started in the first place. Atari users who couldn't afford $1000, $2000, $3000 hardware upgrades to soup up their old Atari ST computers, who instead chose the PC route and used our low cost Atari emulator (Gemulator) to get the speed and performance they were looking for.

The other type of user, the "cutting edge power user" for lack of a better term, to them money is no object, buying a new computer every year is no object, buying new software every year is no object, and just plain being a victim of marketing hype is a way of life. This is the kind of person who buys a fancy race car or a translucent computer without thinking about functionality and practicality. This is the kind of person who will run out and buy Mac OS X for the sake of running Mac OS X without knowing anything about it or knowing why they're buying it. And I have come to the conclusion that we really do not wish to market to this type of brainless individual. A school on a fixed budget looking to upgrade their computer hardware is not going to make such rash purchases. We've sold to a lot of schools, we know what their needs are, and having the latest bleeding edge technology is not it.

The other big pieces of news this week were on the OS front. Microsoft made the long anticipated release of Windows Millennium, the successor to Windows 98, which I actually got pretty fond of as being a somewhat stable release of the 16-bit line of Windows 9x. I still prefer NT (and now Windows 2000), but for the average PC user, Windows 98 isn't too bad. We've received the final release of Windows Millennium, and

discovered one major problem with it already that didn't show up in the beta releases, one that under certain situations can make Windows Millennium considerably slower than Windows 98. And it affects our product which means our development will get side tracked again, as it did with the Windows 2000 release, to work around Microsoft's bugs. I personally can't recommend going out and buying it right now. Stick with Windows 98, or for Pete's sake, if your PC runs at more than 200 MHz and has more than 32 megabytes of RAM, saveyourself the misery and simply upgrade to a 32-bit release of Windows such as NT 4.0 or Windows 2000. If you have a 486 or slow Pentium or have 32 meg or less, then of course stick with Windows 98, that's the kind of machine Windows 95 and 98 are designed for. But not for your Athlon or Pentium III.

Not to be outdone, Apple finally made the long awaited release of the Mac OS X public beta. Many months too late, several months after the rumored free public release at Macworld Expo New York that never happened. Seattle was the North American launching ground of the Mac OS X beta, with several Apple sponsored demos held here in town this week. I attended and looked at Mac OS X and played around with it and also watched other people play around with it. I have to say I am extremely disappointed with both Mac OS X and in the way that Apple is handling it.

Congratulations Apple, you will finally (next year?) offer the same OS technology that Linux and even Windows users have enjoyed for years. Real multitasking. Ooooh. To this day, even Mac OS 9.0.4 is based on a 2 decade old OS technology which is why even today, it isn't very difficult to lock up or crash a Mac and why Apple has to keep putting disclaimers on their software to not use it for critical applications. But Mac OS X is really an entirely new operating system. It isn't just yet another Mac OS upgrade, it's as drastic a step as moving over to Windows NT or to Linux. Completely new user interface, new kernel, limited backward compatibility, and hardware requirements that will put it out of the range of the great majority of today's Mac users. This is not right and watching this week's demos, the more I learned about Apple's future plans the more disgusted I got. This is in fact "the straw the broke the camel's back" and the reason for this letter.

Why can't we all just download the Mac OS X public beta. We each have to shell out $25 to Apple to even get it. That sucks. That's considered "public"? A $25 down payment towards the purchase of a 7 year late OS? As one Apple engineer explained to me this morning, Apple needs to cover their development costs and having people pay for the beta is just such a way. This is a page straight out of Microsoft's playbook. Perhaps it's the money Microsoft injected into Apple 3 years ago, perhaps it's Apple's greed from the 80's, who knows, but I find it sickening that Apple is choosing to force people to pay $25 to have the "privilege" of beta testing a piece of software that now from their own documentation looks as it may not even be ready until 2001. On top of that, as we're finding out the specs on Mac OS X, we find that Apple is pulling yet another planned obsolescence stunt and essentially obsolescing all Macintosh computers more than 2 years old.

Let's think back Macintosh users. Remember good old System 7.0 and 7.5? Those operating systems ran on anything. Whether you had an original 1984 Macintosh Plus or a (then) new 1995 Macintosh Quadra or Power Macintosh machine, one operating system ran on just about every Macintosh ever released. Such a standard OS made it easy for users, made it easy for developers, made it a snap to configure and set up a machine. Apple even licensed their technology to other hardware manufacturers and allowed them to make Mac clones. This was a very smart thing to do.

Then Apple took a wrong turn in 1997. Low on money, they made a deal with the devil (Microsoft) and did two things. They revoked their licensing to other vendors, forcing Mac users to once again buy the slower more expensive Apple computers instead of better clones from Power Computing, UMAX, and others. Then they also cut off about 50 million users in one fell swoop by releasing Mac OS 8, no, not the Rhapsody/X Mac OS 8, but the "Mac OS 7.7 renumbered to 8.0" Mac OS 8.0. In that step, they raised hardware requirements steeply, cutting off all 68000 68020 and 68030 based machines, and even some 68040 machines. Basically, if you bought a machine before about 1995, you were out of luck. Either upgrade or become obsolete! Microsoft and Apple stopped supporting the older machines, as did other major software vendors. You want to run the latest Photoshop? Throw away your $5000 Quadra 950 and buy a $5000 Power Mac was the attitude.

Mac users did one of two things at that point - they bit the bullet and shelled out a huge amount of money on new machines, the new Mac OS 8, and new software. The others, well, they had enough and switched to PCs. Schools did it, businesses did it, ordinary fed up home users did it. In fact, this mass exodus in 1997 which was well documented in the press is what prompted my company to begin work on Macintosh emulation for Windows. Until then, we made Atari game emulators. But with tens of millions of Mac users now being told "you're obsolete, buy new hardware", we saw a market that sure enough developed and has kept us in business for the past 3 years.

Apple is doing it again. By raising the bar so high - you need a minimum of a 128 megabyte G3 or G4 based Mac just to run Mac OS X - that they are making obsolete every single Macintosh over 2 years, and even some newer machines. This action is just plain disgusting. People who bought machines just a couple years ago in anticipation on this new OS now find they're holding useless hardware. If you think your 300 MHz PowerPC 604 machine that you bought in 1998 makes it, forget it. You're cut off. In talking to Apple reps today I learned that the 128 megabyte limit is a bare bones minimum that even they don't recommend. 192 megabytes is the practical minimum. That's beyond the memory capacity of even some of the original iMacs sold only two years ago.

Backward compatibility? Well, you can split your hard disk into two volumes and dual boot, or you can run Mac OS 9 in "classic" (i.e. emulation) mode and watch your existing Mac apps run slower. Mac OS 8.6 and earlier are not even supported in emulation, leading me to wonder

how compatible the "classic" mode even is. Apple just doesn't GET IT! Even Microsoft, the evil empire, and trust me, those who know me know that I am not fan of them, even Microsoft does not pull stunts like this. The Windows NT 4.0 and Windows 98 that you can still buy today for your Pentium III will still run on your 10 year old 486. We do this ourselves here in the test lab. We run NT 4.0 on a 33 MHz 486 with 16 meg of memory. And guess what? It runs. It works. We even run Windows 95 on an 8 meg 386/20. No reason to throw away old equipment if it still runs today's software.

The beauty of PCs, and why I feel Windows ultimately won out over Mac OS in the mass market despite sleazy underhanded marketing by both Apple and Microsoft, is that PCs don't go obsolete every 2 years! Any given PC can run a wide range of DOS and Windows releases. And similarly a given OS runs on a large variety of machines. Windows 95 runs on the slowest 386 (a 14 year old computer now!) to the fastest AMD Athlon. DOS, good old MS-DOS, has run on every PC over the past 20 years. This great backward compatibility is what has made PCs the standard computer.

This is why for the past 5 years my company has produced emulators for the PC platform. Because the whole point of emulation is to run software from different computers on a common platform and we don't want that platform to change on us or our users every 2 or 3 years. If Microsoft came out with new operating systems every two years that required us to rewrite our code or lose a large percentage of our customer base, we wouldn't be happy. If Dell or Compaq or Gateway suddenly decided their new machines won't run DOS or Windows 95 or NT and require only the latest version of Windows, we wouldn't buy those machines. Yet this is exactly what happens time and time again in the Apple world. And people leave and the Mac market shrinks. They use some fancy advertising to win people back. And then they screw them over again and people leave again. Like I said, Apple just doesn't get it! Just as most people don't buy a new car every 2 years (the average car on American roads today is about 8 years old), real people just don't buy new computers every 2 years.

After seeing Mac OS X and seeing Apple repeat its 1997 strategy, I predict a mass exodus of Mac users as a result of the arrogant and irresponsible policy Apple has created for Mac OS X. Poor backward compatibility for old apps. Requiring hundreds of dollars of memory upgrades and possibly even processor upgrades. Added to the insult of having to pay to beta test.

So I've had to seriously think, why do we want to support this in our emulators? With a 192 megabyte memory minimum, with overhead from Windows and the emulator itself, a reasonable PC would require 256 megabytes of memory and a gigahertz processor to run Mac OS X. Such PCs are extremely rare right now and our average customer does not own anywhere near that. For 14 years, our emulators have always been hand coded in assembly to be small, tight, and fast on the lowest end machines. To now develop a product that is only useful to the top 1% of Mac or PC users, well, that's not good business sense or even

interesting for that matter. That's not the original mission of our products and we aren't going to waste our resources catering to a small minority of computer users at this time or forcing our existing customers to upgrade their hardware.

So as I stated, our PowerPC project at this time is being shelved indefinitely until such time as Apple ships Mac OS X, gigahertz Intel and AMD processors are commonplace and inexpensive, we stop having to work around bugs in Windows, and people convince me it's worth pursuing. We've got most of the technology finished, we've shown it, but from a marketing point of view, selling people a fantasy makes no sense.

Our philosophy is to develop products that as many people can use as inexpensively as possible. That's why every emulator we've released in the past few years still has to pass the "486 test". Does it run on Darek's old 33 MHz Dell 486? Does it run on Windows 95? Does it run at a reasonable speed? The PowerPC emulator simply can't pass that test. So until next summer at the earliest, Emulators Inc. will focus on its existing business of developing 68040 based Macintosh emulators and Atari emulators.

Due to the problems with Windows Millennium and other problems we've been working on the past few months, there is a SoftMac 2000 Service Release 3 now being prepared. It is based on the version 8.0 of our emulation engine for Windows which we developed for SoftMac Professional. (Gemulator 2000 and SoftMac 2000 used version 7.0 through 7.2, Gemulator 99 used version 6, and Gemulator 98 used version 5. Version 4 was the Windows 3.1 version, while versions prior to 4.0 were designed for MS-DOS). The 8.0 engine is redesigned to address a number of problems we knew about in 7.x, such as the 1 gigabyte memory limit (the 8.0 engine can support up to 2 gigabytes of Mac memory), it actually uses less memory than the 7.x engine, boots faster, and eliminates a problem reported to us by a number of users about it simply hanging at boot time.

8.0 also merges a number of optimizations into a single engine, a "grand unification" engine, eliminating the need for, as we now have, 3 releases of SoftMac 2000 each optimized for a different scenario. Gone is the demo version, the "online" version, and the "premium" version. The 8.0 based SR-3 release consists of a single EXE file that handles all three scenarios without speed loss, running 68000 optimally, running 68040 code optimally in one emulator. Some features of the 8.0 engine we will strip out, such as the PowerPC support of course. Ultimately the 8.0 engine will be used in our Linux and 64-bit Window ports of SoftMac when we get around to those tasks.

So will there be a public release or beta of this? No. The PowerPC public beta we announced at Macworld is scrapped. We have several developers working on 8.0 and just hired two additional testers this month to put the 8.0 engine through its paces. As per our free upgrade policy and as we have done in the past, we will mail the new SoftMac 2000 SR-3 CD-ROM directly to registered customers. As we cannot offer

product support to non-paying customers and to minimize the load on our support staff, SR-3 will not be posted to our web site. SR-2 will remain the posted version. The upgrade is automatic but I do ask however that customers who moved recently notify us of address changes as soon as possible or you will miss the free upgrade.

We will still demonstrate the PowerPC emulator technology at COMDEX and MACWORLD as planned, but as was the case this summer, it will be a technology demonstration only and not a product release. We are not going to get wrapped up in the frenzy of trying to ship a product for the sake of shipping a product by some artificial date. Apple, Microsoft, and Intel, they can all go fall into that trap and look foolish. Just look at the aborted gigahertz Pentium III, the 5+ year delay of Mac OS X, the 3 year delay of Windows 2000. That's not what this company is about.

To the tens of thousands of Atari customers that helped us get started years ago, I have not forgotten you. New releases of Gemulator and Xformer are planned and will be included on the SR-3 CD-ROM. As we did in the 7.0 products, we are addressing ease-of-use issues and complaints from users, making all the 8.0 based products easier to install and configure. If you are a paid Xformer or Gemulator customer, you can contact us to request your free upgrade CD-ROM.

To address the obvious concerns that we have somehow misled people in the past. We did not ever, at Macworld Expo or elsewhere, set a release date of the PowerPC emulator as some people mistakenly believe. We had hope to ship some time this year, but that simply will not happen. We also have not been promising PowerPC emulation for the past two years as some people mistakenly believe. There are 3 or 4 other development efforts out there in the world looking to create a PowerPC emulator for the PC, and one should not confuse their efforts with ours. Check your facts before sending flame mail!

But I will address my critics and make this offer. If you believe you've been mislead, either in believing that we'd be shipping a PowerPC emulator at some fixed date or that some feature that we plainly demonstrate at computer show after computer show after computer show doesn't work or isn't there, well, don't say we didn't give you the chance to back out. Until September 30th we will refund the purchase price of any copy of SoftMac 2000 sold by us in the past 90 days. That means if you ordered something from us between June 15th 2000 and the today September 15 2000, send it back for a refund no questions asked. If you purchased it in the previous 3 months, between March 15 2000 and June 14 2000, return it for a 50% refund. You must return everything that was ordered and shipped to you - the CDs, the manuals, the ROM cards and/or ROM chips, and we'll apply the appropriate refund based on the purchase date. Prior to March 15 2000, sorry, no refunds, as you've had ample time to return the product already if you were not satisfied with it. Refunds must be returned and received by September 30th. If you decide to seek a refund, email us ahead of time so we know to expect

your package in case of a late delivery.

The satisfied users, and we know most of our customers are quite happy, you will receive the SoftMac 2000 SR-3 upgrade CD-ROM. You will also at that time receive an updated registration code for SoftMac which will work with SR-3 (and which replaces your current temporary code if you purchased our product recently). Again, this will all be automatic, but please notify us of address changes and mail in your product registration card if you have not already done so.

Critics aside, our company already takes a number of measures to protect our customers and make our software easy to use. We post free demos, we post hardware requirements, we post step by step instructions with screen dumps on how to use and install our products. And still, in this day of MTV induced short attention spans, it amazes me how many people just blindly buy a product without so much as reading the specs. We don't apologize to stupid customers. We still refund the occasional customer every few weeks because someone thought they were buying a Windows emulator for a Mac. Read the specs please. And with this whole nonsense of paying for betas and upgrades, we're one of the few companies that not only offers free upgrades by web, we offer free upgrades on CD-ROM at no cost to the customer. I'd like to see Apple or Microsoft give away free upgrades of their products. We don't believe in their business model, the model of planned obsolescence and of squeezing money out of you at regular time intervals, including paying for beta releases. Emulators Inc. is not a public company, it doesn't have to please shareholders or stock market gurus, and so we don't need to resort to such blatant stupidity to stay in business.

So as I was saying, we are not going to fall into the trap that Apple, that Microsoft, that Intel, and even our competitors fall into. We are not promising any more freebies, we are not going to cater to the top 1% of the market even if it looks sexier, but we are going to continue to cater to the majority of Mac and Atari users who don't have $100 bills coming out their noses. Intel, Apple, and Microsoft, get your acts together and stop putting out defective products and setting a bad example for the industry.

Regarding the tutorial, yes, that is not in jeopardy! Back in 1987 I wrote my first emulation tutorial in a print magazine, on 6502 emulation, and last year started to write a new tutorial on how to do 68040 emulation. The tutorial was to be published by a well known programming magazine, but I simply missed the deadline due to my busy schedule. The idea of the tutorial was rekindled this summer when our company acquired Fusion PC and we rewrote that 68040 core. That gave me a lot of new material and definitely lots of example code for the tutorial. Since I cannot devote my full time to writing the tutorial, I will write it in pieces, beginning once again with 6502 emulation to start with basics, release the sources to the Xformer emulator, then work on up to 68000 emulation and Gemulator source code, and finally 68040 emulation and Fusion PC source code with before and after examples

of how to optimize code. I feel these tutorials are important to all programmers, not just emulator developers, because the art of writing assembly code is slowly dying out, and I'm sorry, C++, Java, 15 megabyte executables, and "DLL hell" are not the answer! Any monkey can crank out code that half assed works. In the business they're called "contractors". But that's not how to write an emulator or any speed critical software.

If I missed something or if you have a legitimate question about our future products, please feel free to email me directly at darekm@emulators.com. Again, all you poor misled customers, please get your returns in by September 30th. Contact our sales staff at sales@softmac2000.com regarding upgrades and refunds, do not contact me about it. I welcome seeing everyone, customers and critics, at COMDEX in Las Vegas and at Macworld Expo in San Francisco this winter.

And now folks, let's all take a little break from this Mac OS X / Windows Millennium / Pentium madness and enjoy the Olympics. Sydney is one of my favorite cities in the world to visit and I highly recommend the trip to anyone. I only wish I could be there right now but I'll settle for watching the Olympics on TV. And I hope I don't see too many Apple, Intel, or Microsoft commercials.

Darek Mihocka
President, Emulators Inc.

September 21 2000

Since the letter above was posted last week it would seem people are finally starting to wise up. The "Intel massacre" taking place today, causing Intel, Microsoft, Dell, Apple, AMD, and other computer company stocks to drop sharply, even to below 52-week lows, really should come as no surprise to anyone. The technology joyride has come to a sudden stop and don't say I didn't warn you! The truth can hurt folks, stop wearing your rose colored glasses!

September 23 2000

The weekend after the Intel Massacre and investors (or should I say "gamblers", c'mon Soccer Moms, stop gambling away your children's futures away), investors can finally take a day off and tally up their losses. While I'm not going to pull an Al Gore or a Rush and pretend I predicted the stock market disaster, I can't say the signs weren't obvious. I hope at least one person out there that had a chance to read my letter of September 15th was wise enough to yank any Intel Apple and Microsoft stock from their portfolio. Watching Intel plunge more than $30, or 40%, from its hyped up prices just 3 weeks ago was very refreshing and well deserved. Watching Microsoft get dragged down to a 2 year low is also well deserved for them.

It's sad though that it took the smell of MONEY, or the chance that Intel would make less of it, to give "investors" the kick in the ass

they needed to dump that stock. Not the delay of the Pentium 4, not the complete abortion of the 1 GHz Pentium III, not the thorough butt kicking that the AMD Athlon chip has been giving the Pentium III for the past year, none of those hard technical facts influenced dreamy investors. In fact, after last month's Pentium III abortion, Intel stock actually surged for a few days, defying all rational thought. Again, it took the smell of money to actually wake them up. Just an example of how hype driven this computer market and how poorly educated most people, even Wall Street "experts", are about computers.

Let's look at some of these tech stocks:

�� AMD:

*

prior to this year, not a Wall Street darling, and deservedly so. It's AMD K5 and K6 processors were cheap knock offs of Intel Penitum chips. Yes they were cheaper. But were they faster? Hardly. AMD stock stalled at about $10 and below.
*

late 1999 - AMD launches the AMD Athlon. Emulators purchases a system for testing and we get blown away by the performance, up to 40% faster than the Pentium III. We post a strong recommendation on our web site to use AMD Athlon processors. Other people have similar results, AMD stock starts to deservedly rise.
*

after demonstrating a 1 GHz processor at CeBIT Hannover and announcing it here in the U.S. a few weeks later, stock really starts to surge, well above $20. But one has to wonder, almost a million people go to the CEBIT Hannover show, and yet again, investors did not react immediately to the showing of the 1 GHz processor at CEBIT, they waited to react until after it was "announced" weeks later. Again, stupid Wall Street gamblers with no technical background playing with a lot of money. Take it away from them!
*

AMD deservedly reaches a high of almost $50 during the summer.
*

September 22 2000 - as the titans Intel and Microsoft collapse under their own weight, AMD is (and I think unfairly) also punished in the Intel Massacre and drops to $24. Again, stupid investors making knee jerk reactions. "oh, the market is down, sell, sell" without knowing why.
*

September 23 2000 - perhaps a sign that there is intelligent life out there after all, investors reward AMD with a 10% gain while Intel collapses over 20% in a single day. I happen to like the "K7" (Athlon) architecture and will be buying more Athlon based machines for my own use. Too bad Dell, your love affair with Intel is keeping you out of the

game.

As a side note, I just loaded up on a ton of AMD stock to put my money where my mouth is. We'll see how I compare against the Apple Intel and Microsoft stock holders.

�� Microsoft:

*

end of last year, even after preliminary news that spelled disaster, stock is at $120 a share, riding high on company propaganda about "getting off"
*

April 2000 - as every April, the whole tech industry cashes in stock options to pay the previous year's income taxes on even more stock options. Stock option king Microsoft leads the market meltdown by dropping to about $70 (c'mon Soccer Moms, every April is bad, why did you all act so shocked when the Dow dropped 700 points the day before taxes were due? I dumped my stock portfolio in late March and I don't even have a business degree, he he)
*

May 2000 - Microsoft gets spanked big time - $60 - investors realize the honeymoon is over
*

July 2000 - the annual running up of Microsoft prior to the release of the annual report - breaks $80, those silly Microserfs breathing a sigh of relief.
*

September 22 2000 - no one gives a damn about Windows Millennium - the lamest and most boring Windows release in years - stock flirts with $60 again. Sorry Microserfs, get back to work on Windows NT 6.0 (the long promised merger of Windows 9x and Windows NT).

Interesting news article on Microsoft's own news arm - MSNBC - about how poorly received Millennium is. Someone at MSNBC is going to be fired for reporting it like it is (so better read it before they yank it): http://www.msnbc.com/news/460342.asp

�� Apple:

*

strong surge in stock last year (from under $20 to over $50) as they crank out more and more colors of iMacs for brainless idiots and keep promising that NT clone called Mac OS X.
*

stock hits new high in July as Mac users eagerly await the rumored free release of the Mac OS X public beta at Macworld Expo New York. Even I

was excited on my way to New York.
*

July 2000 - oops, no beta, oops, product delayed another 6 months (what's that now, 5 year or 6 year delay, I lost track). Stock drops below $60, below $50, wheeeeeeh, flirts with $45, a 25% drop in the two weeks after Macworld. Even the Mac faithful seem to be getting nervous!
*

September 2000 - stock surges again to $60 on news that the public beta is once again coming out
*

September 23 2000 - Thunk! Stock dives to $50, manages to sustain $52, after people start getting their hands on the Mac OS X beta and see that it does mostly suck

And yes, our Mac OS X beta CD-ROM did arrive this week. I installed it on our big expensive 512MB 500 MHz PowerMac G4, and it's quite under whelming as many of you will find out when you get your beta. Once you install Mac OS X, say goodbye to backward compatibility. Only Mac OS 9 is supported in emulation, (or "Classic" mode as they call it) and so Mac OS 8.6 and earlier are history as far as Apple is concerned. So were many of the older 68K and PPC apps we tried to run on it. Lots of ideas stolen from Windows NT, OS/2, and Linux, and just way too many flashy buttons and graphics sucking up CPU power for no useful purpose. I'll report more on OS X as I pick it apart some more. But all signs back up my logic from last week that Mac OS X will be a poor upgrade path for many existing Mac users, not to mention to it will make your wallet poorer.

It's interesting that MSNBC was actually not as critical of Mac OS X as of its own master's product, however this article about the recent Mac OS X beta launch in Paris does mention many of the concerns by Mac users in France as I witnessed here in Seattle last week, namely slow speed and high cost. Read it yourselves:
http://www.msnbc.com/news/459088.asp

While the email Inbox was certainly full of "you're an idiot, shut the f**k up" emails last weekend, the stock market collapse this week did shut a lot of people up. Regardless of the vile and rude feedback, I am sticking by last week's decision to postpone work on the PPC emulator. In light of the poor stock performance of the major computer players, hopefully this is the kick in the ass they need to stop bullsh*tting the public and start producing. Microsoft needs to ship a service pack to Millennium right away. Apple needs to remember to ship Mac OS X hopefully before the next Star Wars film is out (I mention that due to the May 2002 expiration date on the beta!). And of course Intel needs to either ship a gigahertz+ processor or be shut down by AMD.

The feedback I'm getting from people about Mac OS X is a mixed bag, some people still claiming that the "final" release will run on 64 meg

machines just fine. That remains to be seen. Others agree with me that the hardware requirements are just too high. Someone also pointed out to me that in 1997 Steve Jobs promised that all the current (i.e. 1997) machines would run the new OS, yet the latest Mac OS X specs require a minimum of a 1998 G3 machine. Hmmmm, is it really true that Mac OS X will run on 601 and 604 based processors and on older Power Macs? Time will tell.

I'm not one to hold back an opinion, but I also don't make uneducated statements. Which is why I'm not here talking about microwave cooking. I do my homework, I do the footwork, I go to CEBIT and I witness the gigahertz Athlon myself. I go to Macworld and their other shows to see what they actually have. I talk to real live Mac users and ask them their opinions. Based on my research and experience, I strongly believe that Apple is about to shoot itself in the foot with Mac OS X and emulation _will_ be the solution for running older Mac software on new fast hardware in the future, just as it made sense in 1997 when I started this venture. But it won't make sense to do it on Mac OS X, which itself will be running emulation, and is an NT clone with double the horsepower requirements of NT. It just doesn't make sense. If you want the power of NT or Linux, you want cheaper hardware, you buy a PC today and you run a Mac emulator today and not wait till 2001 or 2002 for Mac OS X. It's just that simple. I'm in the business of emulation because it was the obvious solution 3 years ago and it still continues to be the obvious solution.

As I've explained, we're not canceling our PowerPC emulation work, we're just putting it on hold until the market is right for it, and we're certainly not going to waste time doing any work to make Mac OS X itself run in emulation. We'll support Mac OS 9 first, then possibly Mac OS X but not for a whole. Rude emails be damned. I will be present at both Comdex Las Vegas and Macworld San Francisco this winter and will be on hand at the Emulators booth at both shows. I more than welcome hearing in person your opinions. Don't just hide behind email. Come out to a show. SEE what people actually think and hear and see, and then make an opinion. That's all I ask that people try to do - THINK - before they send me an email shooting off at the mouth about things they don't really understand.

Darek Mihocka
President, Emulators Inc.

Ahhhh, but I am a Kiwi. Besides I live in Melbourne, it is the Sydney siders
that are strange:-). Well truthfully most Aussies are weird....

Crying on spilled milk.... that we macsters will have a new OS? Better
late than never. In the meantime in the last two years, Apple has come
out with iMacs, G4 Towers, G4 Cubes, Aiport Technology etcs...You get the
point.. Whats the maker of the Milan excuse?

No, Sincrap - we calls it "tryin' ta play catchup", as you keep usin'
as a sledgehammer. When ya considers dat even Ataris have had true
pre-emptive multitasking wit' MagiC for years, OSuX looks like a
johnny-come-lately....

>

ha ha - typical troll crap! Dis comin' from da same guy who claimed
dat in Germany dey were selling tons an' tons of iMacs - turns out dat
Crapple now holds a mighty 2% of all PC sales dere. Surely dere gonna
take over Europe wit dose numbers, NOT. Not in Atari and Amiga country.
And especially not at da snail speed of da G4 - it's up ta a mighty
550mHZ, folks.

An' ya'll have ta re-tool yer definition of vapor, sincrap - 'cause
it doesn't jibe wit' da traditional. Milans do exist, and Milan II was
shown in prototype which many people saw. Not da definition of vapor.
Copland is da definition of "vapor".

BTW, I've been readin' all yer postin's via Deja, and I've nevah seen
such a pile of crap comin' from such a swell-headed cretin wid no life
since da days of Fnarky. Are ya sure you've never been institutionalized
or had help from a headshrinker?

>
> nah...just a paint program on the pismo..

more likely finger paint on da wallpaper - mommy spank!

5555. Apple Tanks 46% After Earnings Warning - Da Party's Over, Sincrap

Newsgroup: comp.sys.atari.advocacy

**** looks like, despite all his denyin' dat he ever said it, dat's sincrap's prediction dat Emperor Jobs would destroy Apple if he ever came back has finally come true.

Even da Milan II despite its problems is a bed of roses compared ta da idiocy which expouses dis mess. All dose poor deluded Apple gulls who bought stock in da overinflated days are probably lookin' for cardboard boxes ta sleeps in tonight.

Expecially reads dat Apple's problems are NOT part of an industrywide problem, but a problem of its own makin' , due ta bog-slow processin' and all-glitz, no-substance of da Cube.

Little more salt on yer crow, sincrap? Ya should t'ink about goin' to a more stable industry which fits yer capabilities. Like servin' at macDonalds, ya don't need brains ta say "would you like fries wit' dat" :)

http://cnnfn.cnn.com/2000/09/28/technology/apple/

****News: ****Technology

Apple warns on earnings
Computer maker cites slow education, G4 Cube sales for shortfall
September 28, 2000: 6:34 p.m. ET

NEW YORK (CNNfn) - Apple Computer warned on Thursday that its earnings for the fourth quarter ending Sept. 30 will be substantially below expectations because of slower-than-expected sales in September.

The Cupertino, Calif.-based company said that it expects to report revenue of between $1.85 billion and $1.90 billion, and earnings per diluted share, excluding investment gains, of between 30 cents and 33 cents, when actual results are announced on October 18.

Analysts had expected Apple (AAPL: Research, Estimates) to earn 45 cents per share for the quarter, according to estimate tracker First Call.

In response, Apple's stock plunged to $29 in after-hours trading, down 46 percent from its Thursday close of $53.50. The decline knocked about $8.9 billion off the company's market value.

Fred Anderson, Apple's chief financial officer, said that the company's education-related sales, which normally peak during September, were lower than expected. In addition, its Power Mac G4 Cube is off to a slower-than-expected start, he said in a statement. Apple indicated that the sales slowdown is more than a one-quarter problem.

"We are currently re-evaluating our plans going forward, and will provide lower growth targets for next quarter and the next fiscal year when we announce our final results on Oct. 18," Anderson said.

"We've clearly hit a speed bump, which will result in our earning, before investment gains, approximately $110 million rather than the expected $165 million for the September quarter," said Steve Jobs, Apple's chief executive. "Though this slowdown is disappointing, we have so many wonderful new products and programs in the pipeline, including Mac OS X early next year, and remain positive about our future."

Third-quarter report contained signs of slowdown

Apple's third-quarter earnings report, which came out last July, gave hints of a slowdown in the company's business. When the company reported its third-quarter results, it said that sales of its iMac machine were below expectations, apparently because consumers are waiting for the company to introduce a new version.�

"I don't think we have any evidence that it is an industry-wide slowdown," Anderson said during a conference call with analysts after the third-quarter earnings were released.

Merrill Lynch analyst Steve Fortuna had forecasted that Apple would have 13 percent unit growth and an 8 percent rise in average unit prices in the third quarter. Instead, Apple delivered 12 percent unit growth but only a 3.5 percent increase in average unit prices because of changes in its product line.

Not industry-wide

Apple's problems appear to be limited to the company, rather than being part of an industry-wide slowdown in personal computer sales. After Intel �(INTC: Research, Estimates) warned that its third-quarter revenue growth could be as little as half what some analysts had expected, analysts surveyed PC companies to see if they also were experiencing slumping sales. Several of the major PC makers responded that their revenue and earnings were on target for the quarter.

Computer maker Hewlett-Packard (HWP: Research, Estimates) announced one day after Intel's warning that it should meet revenue and earnings goals for its fiscal fourth quarter and that it would conduct a $1 billion share-buyback program. Likewise, Dell Computer's (DELL: Research, Estimates) chief executive said that the company is on track to achieve 30 percent revenue growth for the full year and that Dell hasn't changed its outlook because of Intel's problems in Europe.

In an interview on CNNfn's Moneyline News Hour Thursday, Michael Capellas, chairman and chief executive of Compaq (CPQ: Research, Estimates), the world's leading PC maker, pointed out that his company operates in a much different market than Apple and said Compaq "feels good" about where it is headed, strategically. [160K WAV or 160K AIFF]

Capellas would not comment specifically on the company's third quarter results.

Apple's revenue and earnings have been driven largely by sales of its iMac and PowerBook computers. As of the end of the company's third quarter, Apple had shipped 3.7 million iMacs since its introduction. Apple introduced the G4 Cube on July 19. The Cube, which is less than one-fourth the size of most PCs, won praise for its innovative design and the ease with which accessories could be added. However, it was criticized for being too expensive at $1,800 and for shipping with too little random access memory.

5556. More Salt In Sincrap's Wound - older Mac glut!

Newsgroup: comp.sys.atari.advocacy

I'm sure the news is everywhere by now, but here are two refs:

http://yahoo.cnet.com/news/0-1006-200-2888711.html?pt.yfin.cat_fin.txt.ne
http://www.upside.com/Money/39d3c41c0_yahoo.html

Of note, the description of G4 Cube sales being slower than expected.

Also, can someone explain why "a surplus of older Power Macs in the
retail channel appeared to be hurting sales of the new machines."?
Wasn't this something Apple allegedly went to great efforts to
prevent?

Lets see.. Q4/99 $1.3 Billion versus Q4/00 $1.9 billion. Looks like a huge sales increase.

read da article, ya peon. Also check da online stores, dey seem ta
have lots of older iMacs and other older Macs dey're just dyin' ta get
rid of.

let's see, projected sales DOWN 33%. Apple issues warnin' that dey're
not gonna be anywhere NEAR what dey've projected. Word comes out dat
older iMacs are cloggin' da channels, preventin' sales of da new crap,

er crop. Especially point out non-sales of da overpriced, underpowered,
underfeatured Cube.

You're full of beans...The prior iMac line is about gone, no surplus. The
latest issue of MacWarehouse and Mac Club has no listing of the older
iMacs. The older iMacs when quick when retailers dropped the price.

Nice try!

Not substantially down. Sales are actualy up by $500-$600 million
according to Apple's projections. Not enough to meet their goal target.

> who's laughin' now. sincrap?

I am. Will accumulate the stock at half the price and see it increase
later in the year.

Apple was projecting $2.1 billion earlier in the quarter. Apple did not
refresh the iBook and PB line until mid September which was to late to
affect the quarter sales. Company used Q4 to dry out the channel of the
older PB and iBook line. Q4 is usually a product transition time and
execution is tricky.. But watch out for Q1.

and to da many others who you've tried ta crush and failed miserably.
Like let's say Dreibelbis, van Tilbourg and Particle Salad - all three
have reduced ya ta a quivering bag of rat droppins smellin' of alcohol
wheneva ya made tha mistake of takin' 'em on. Particularly Salad, who's
shown yer a complete idiot when it comes ta da video market. Even
taday, whenever yer name is mentioned, it's mentioned in da same breath
wit' "no life", "imbecile", and "liar".

>
> >

no, sincrap - tryin' ta compare TOS 1.0 ta OSuX is pathetic. Ya have
never used MagiC, which has grown inta a really nice OS wit' some great
widgets. And solid as a rock. Everytin' OSuX is frantically tryin' to

copy as it slips later an' later. Even Linux an' Windows NT have betta pre-emptive multitaskin' den any Mac OS, and had it first.

we'll go anywhere we want, and say anythin' we want. nobody here is afraid of a little wimp like sincrap, an' nobody's gonna be pushed around by yer pathetic bully boy antics which've failed since day one. Give up now, weinie boy.

> > > > please, all yas Atari pushers note - Sincrap has a problem with

da one rapidly goin' over da cliff? Da one dat can't crack 500mHZ when da dreaded Intel an' AMD have gone 1 gig and beyond? Sorry, sincrap, but we ain't impressed wit' doctored benchmarks an' outright lies. Neiider are new users, who are seein' through Jobs an' your smoke n' mirrors.

Dere are still Mac users out dere who still use da ol' processors - and ya still called dem idiots fer usin' em. Foot in mouth time fer sincrap!

> >
> > please everybuddy note - sincrap's called all Macs made wid dose
> > processors crap, and all dose who still make use of dose systems
> > productivelly as idiots for usin' dem.
>
> The last macs to roll off the assembly line with an 040 was in 1995.

and dey are all still workin' and still productive an' usable. I've read many articles about people who still use dem, and make dem usable for all dose less fortunate. Ya just called everyone who uses such a machine nothin' but worthless peons just becuase dey use an older system dat still works ta dere satisfaction. Shame on ya, sincrap!

>
> > Da Palm Pilots use a 68000 - millions of dose are in use. Are all
> > Palm Pilot users idiots?
>
>
> Were talking about a handheld here..

a handheld dat's sold ta millions and has proven very useful. Again, are dey all idiots fer usin' a device dat uses a microchip ya personally despise becuase it's used in an Atari?

> > > You were saying...
> >
> > get da crap outta ya ears, Sincrap - it's da result of keepin yer

nobody here named chunks - are ya seein' an' hearin' things? ah,
yeah, Dan warned me if ya started usin' dat name dat means yer losin'
yer argumant and yer cool. looks like I'm makin' points.

he also told me dat you also start mispellin' yer words - guess yer
huffin' an' puffin' in a rage, eh, sincrap?

> > ha ha - typical troll crap! Dis comin' from da same guy who claimed

> > 550mHZ, folks.
>
> Oh PhULeaze! What sales are the Milan? The iMacs have done well in
> Germany recently and bonkers in the UK..

da only ting bonkers is youse, sincrap. in spite of all yer jumpin'
up an' down about how crapple increased market, crapple only managed 2%
of da market in Germany - dis was reported on da Mac Show Live a few
weeks ago an' even da host was not impressed wit' da results despite da
hype, and I'll trust dem over an annoyin' little hemmeroid like sincrap.
crapple hasn't made any friends in Britain eider wit' dere shenanigans
over not keepin' dere word on showin' up at trade shows.

What marketshare does the Milan
> have?

we accept a small marketshare, sincrap, cause we don't into
weenie-pullin' contests over a usefull tool. not unlike a certain
useless tool named sincrap...

>
> > An' ya'll have ta re-tool yer definition of vapor, sincrap - 'cause

> ancient history.

` which was hyped an' hyped by crapple as "da next big ting".
everywhere an' evering ya saw in da crapple press was about Copland.
Apple pull plug on Copland. Copland vapor. Finis. Passed on. ceased ta
be. pinin fer the fjords.

really, is dat da best ya can do, sincrap? i can pull a bettah
argument outta my ass.

>What other software has Apple come out as well?

ya mean like Appleworks 6 - knwon to all an' many as "Appleworks
Sux"? or da vapor drivers fer da extended keyboard dat's comin' "by
January" why does it take genius crapple engineers Five Months ta write
a proper driver fer an extended keyboard, sincrap?

>
> > BTW, I've been readin' all yer postin's via Deja, and I've nevah

i tried to explain to sinclap that for apple to go it alone, it simply
will not work, they have a nitch market, to expand that market you need
innovative software written to take advantage of the unique hardware
architecture that motorolla machines provide.
to get that software you need to get atari/commodore small developers on
board to get them coding modern software for all 3 machines.
the code is similar as far as i know, and can be ported over with out
all of the bloat, and bugs in pc stuff.
he could not understand that apple is not benefitting from well written
software taking advantage of the good hardware, instead they get pc
portovers bloated, and bug ridden and just slightly faster, thats not
enough to show customers a real difference.
but if you had code written for 3 thriving nitch platforms you can find
some real jewels for all.
instead he gave me a juvenile response about a apple plan to double
there market share, every one hopes for that, but how many can.
apple cannot do it on hardware alone, just ask any surviving atari
dealer.
thanks,
lance

Apple at the crossroads
Computer maker struggles to appeal to users beyond its loyal customers
By Staff Writer David Kleinbard

September 29, 2000: 4:57 p.m. ET

NEW YORK (CNNfn) - Apple Computer, long an orphan in a world dominated
by IBM-compatible personal computers, stands at a crossroads.
One day after Apple (AAPL: Research, Estimates) warned that its
fourth-quarter earnings and revenue would fall below expectations,
investors decided it was no longer a core holding, and investors sliced
its value in half. In late afternoon trading Friday, the stock was down
$27.50 at $26, a 51 percent plunge. The market's reaction caused Apple
to lose about $10 billion of market value in one day. Trading volume was
more than 20 times Apple's daily average.

"We've clearly hit a speedbump, which will result in our earning, before
investment gains, approximately $110 million rather than the expected
$165 million for the September quarter," said Steve Jobs, Apple's CEO,
in a statement. "Though this slowdown is disappointing, we have so many
wonderful new products and programs in the pipeline -- including Mac OS
X early next year -- and remain positive about our future."

>try "goin' off da cliff" <

>Most of the analysts who downgraded Apple Friday said that the revenue
and earnings shortfall was a company-specific problem, not a sign of a
slump for the entire personal computer industry.<

>"In our opinion, investors should not read this Apple blowup as
evidence that PC demand is weak," said Merrill Lynch analyst Steve
Fortuna in a research note. "Apple is, in many ways, a market unto
itself."<

>Apple benefits from having an extremely loyal customer base that verges
on the fanatical. However, to keep growing, the company needs to sell
products and services beyond its current installed base, converting
computer users from the "church" of IBM.<

(sound like certain no life Macccie troll? wait, stupid sincrap too yellow to actually take on PC users, he instead take on smart Atari users who kick sand in face)

>They are primarily selling into their installed base and are not expanding their markets," said Kevin Knox, a research director at the research firm Gartner in Stamford, Conn. "Design innovation only gets you so far. It's hard to continue growing if you keep selling into your installed base."<

(where all dose new users, sincrap?)

>"The important question the shortfall raises is whether Apple will be able to attract new users to the Macintosh platform to continue to grow its market share," said UBS Warburg analyst Charlie Wolf in a research note. "The shortfall raises ominous questions about whether it can." Wolf lowered his fiscal 2000 earnings estimate for Apple to $1.71 per share from $1.86 and his fiscal 2001 estimate to $1.80 from $2.10.

Balance sheet is strong

No one is worried about Apple's solvency. The company has had 11 consecutive profitable quarters and intends to be profitable in the fourth quarter also, although those profits will be below previous expectations. In addition, Apple finished the quarter with a healthy $3.8 billion in cash and short-term investments.

>On the other hand, Apple's share of the computer market is in the low single digits. <If the company loses what little share it has, software developers may stop writing for the Apple platform, and dealers may stop selling the machines, analysts said.

>"It's very difficult when you have as low a market share as they do to get dealers interested," <said Bruce Tognazzini, who worked at Apple between 1978 and 1992, ending up with the unconventional title of Human Interface Evangelist. "A dealer has to sell a Mac, whereas he doesn't have to sell a Windows machine, since the Windows machine is a known quantity."

(dis from Apple employee who knows stuff. not like phony like sincrap, who make things up.)

"Steve Jobs has done a good job of selling, and the Apple interface is still superior, but he doesn't have critical mass," said Tognazzini, who now is one of the partners at the computer design firm Nielsen Norman Group.
In addition, Apple's announcement on Thursday was especially troubling because it noted that the company's sales have been weak in the education segment, a part of the market Apple historically has dominated.

>"We do not see this as a one-quarter phenomenon for Apple, but rather as the beginning of many tough quarters ahead," Merrill's Fortuna said.<

(Merrill lynch guys smart. kno market. stupid sincrap no kno good stock even if it bite bum)

Company was saved by innovative design

As recently as December 1997, Apple was at the brink of ruin. The company had an operating loss of more than $1 billion that year, and its stock was below $7 by December. In 1997, Steve Jobs returned to Apple, after having been cast out of the company in 1985. In the ultimate form of vindication, Apple paid more than $400 million for Next, a company Jobs started after being expelled from Apple.
Jobs brought Apple back from near death with the trendy-looking, colorful iMac and PowerBook lines. The iMac -- which now comes in colors such as indigo, ruby and sage and starts at about $800 -- has shipped about 3.7 million units since its introduction. Apple also was helped in August 1997 when Microsoft (MSFT: Research, Estimates) agreed to invest $150 million in Apple and continue making its Office suite for the Mac. As part of the deal, Microsoft's Internet Explorer became the default browser for the Mac operating system.
Apple's most recent major innovation was the G4 Cube, a machine so elegant that many observers said it deserved a place in the Museum of Modern Art in New York.
"The G4 is about the nicest industrial design that I have seen anywhere," Tognazzini said
.
>While the G4 is powerful, easy to upgrade, and less than one-fourth the size of most PCs, it has been criticized for being too expensive at $1,800 and for shipping with too little random access memory. In its press release issued Thursday, Apple said that sales of the G4 are off to a slower-than-expected start, providing no detail on why.<

(me know why. and me no claim ta be crapple power rep, too much. too litle. to late.)

>"We believe that the Cube is too pricey at $1,799 to appeal to consumers in volume, while few professional users are going to opt for the Cube based on its award-winning design,"<
said Merrill's Fortuna.

No compelling reason to upgrade
^^^^^^^^^^^^^^^^^^^^^^^^

>Aside from the G4, Apple hasn't introduced new products recently that give its customers a compelling reason to upgrade, analysts said.
"I don't see anything next quarter that will result in massive upgrades," said Gartner's Knox. "Coming out with new colors is not going to drive a substantial number of upgrades. Going from blueberry to ruby is not a good reason to replace your machine."
"Apple has a lack of any real new products to drive strong year-over-year unit growth," Fortuna said in a research note. "Its existing products are getting stale."<

(again, i coulda told dem dat. me no rocket scientists. perhaps Jobs should hire me, me give good ideas and no suckup like sincrap)

Knox said that Apple needs to derive more revenue from sales "outside the box" -- products and services outside of the computer itself. Apple needs to follow the lead of Gateway Computer (GTW: Research, Estimates), which has been successful at generating profits from extra services, such as Internet access, he said.

"Bragging about megahertz and megabytes is a thing of the past," ^^^

> lately.

yes, he has, TiFKAS - Apple is currently back in "beleaguered" mode.
Even they have admitted that sales of the high-end systems are way down,
which are the real bread and butter for them to make money. The fact
that iMac sales are ALSO way down despite the makeover is big trouble.

I think the thing that has REALLY triggered the current problems are
Apple's admission that they've taken a big hit in the education market.
This is one of their specialties, and to have them lose any significant
part of that market, AS THEY ADMIT, is certainly a sign of trouble.

Apple does have software that has no peers in the wintel land
> such as iMovie, Final Cut Pro, QTVR, QT, Web Objects, Sherlock,
> AppleScript and the list goes on. Plus OS X, which is bringing in the
> shareware folks from Unix and linux land..

problem is, TiFKAS, that NOBODY IS BUYING NEW APPLES LATELY. Particle
Salad has already explained at length why a G4 is currently NOT a good
choice for video production (in part because of Job's absolute refusal
to produce a 6-slot PCI Mac, which is crucial to run the hardware they
need), and why Final Cut Pro is STILL Not Ready For Prime Time in
regards to professional video production. But you still ignore this and
wibble on and on and on with your RDF, which in these parts is the
equivalent of "I do so have a bigger one than you do!"

I saw OSX in action at a dealer last week, and it has some really
nice functions. HOWEVER, it's obvious that there's going to be a lot of
work still before this OS is going to be ready, especially in light of
the fact that OSX was quite sluggish - and this was on a G4 Cube! Even
MagiC on an early ST runs much faster! Add to that that the beta didn't
even have drivers for USB and Firewire, which are crucial in light of
what current Apple hardware is capable of. And it had better have plenty
of new software ready for it when it finally does launch.....

Perhaps the reaction of the market is going to be the wake-up call
for Jobs to make him realize that it's the CONSUMER who calls the shots
on what he needs, NOT the manufacturer telling him "the is what you
need, and this is all you're gonna get - we know best". Marketing hype
just doesn't cut it anymore, just look at the failure of the Cube.

Apple is doing fine thank you..
> Q4 is tends to be a challenge due to product line change overs...Sales
> were up by $500 million plus over the same period last year...

the consumer and the market currently do not agree, TiFKAS. Even Jobs
agrees that there are serious problems. You're actually defying Steve
Jobs? Get out of the Reality-Distortion Field and start breathing some
oxygen....

crapple market research crap - just like crap crapple market hype.
why ya use nothin' but one-side crapple garbage ta prove point. oh sorry
me forget, ya never had point, never will.

by da way, sincrap, crapple market share currently 3.7% across world.
Up .7% in 3 years. Dis is progress?

only fiction is sincrap sayin' he big shot crapple salesman.
everybuddy know gates put jobs foot over fire and threaten ta crush
apple like bug if he don't put Exploiter on Mac desktop. jsut like gates
put gun ta scully's head if he even dare ta come out wit' basic program
ta compete wit microsnot. it all documented. gates give word, pull
office, crapple take dirt nap. end of crapple, sincrap buy PC and harass
mac users fer change, as how he work, like how he shaft amiga user after
bein' big cheerleader fer dem. like how he shaft atari user afer havin'
slight thing happen dat make him go funny in brain. sincrap ferget
computer is tool, not other tool 'tween legs.

sinclap,
my son has a g-4, i watch this stuff, it is not much faster than the pc, and he even admits it.
are you so sure that the code that is used in your mentioned post is not pc code ported to apple?, or altered for apple?
you need really good fast software to impress the average user.
they have been brain washed that speed is everything, and when i see a apple program booted that is at best marginally faster, even i am not impressed, and i hate the pc.
being stuck in the past is not all that bad, afterall the mac is a machine from the past, the pc is considered modern since most experts say that the modern computing era started in the early 90's.
the mac dates back farther than that would you not say that sinclap?
i have found that to overcome the hysteria of speed, you need good tight compact speedy code that takes advantage of really good hardware, thus nuetering the cpu speed, and wowing the average type in how did they do that, and i want it. instead
apple has fallen into a trap trying to outspeed the pc, and not building a business based on really good software that really shows off the hardware.
jobs is a good hardware type, but so was jack, we know what happened to jack, jobs may be next.
now i do not want this, i think that all should benifit from good solid code, but that code cannot soley come from apple, there are just to many good coders for the other 2 platforms to pass them up.
i am not so sure apple has that many good motorolla coders left, after all when the pc bunch took over apple, everything started to bloat like the pc.
you answer the merits of my arguments with very illogical answers, or borderline insults.
why am i getting the idea that i may be trying to convey simple business strategies to a adolecent, or immature person?
thanks,
lance

me accept Milan market for what it is - razor no dummy. razor wish
tings better. me just givin' boots ta sincrap fer bein' such a
pie-in-sky moron who hang on every word jobs say witout havin' one
thought in head 'bout what's real. 'bout time dat big bully got what
comin' ta him.

ya call 3.7% worldwide decent? 'specially after two years, razor no
understand why 0.7% increase consider good. face it, microsloth win big
battle by playin dirty pool, other platforms lose includin' crapple.
hope linux make difference. Milan get there act togteher, hopefully soon
- no want ta have ugly windoze box on desk.

however, all not right in mac land - were I live, mac dealer drop
like flies, dont help dere titles are da same month after mont. local
dealer here have sims for 85 clams - how can honest mac fan affords? and
mac magazine gettin' thinner an' thinner. razor buy old copy of macworld
few months ago from goodwill, it about as thick as vogue. new macworld
about 1/4 as thin - soon, if tings don' improve, macworld be as thin as
comics book.

razor like new amiga by the way - smart. too bad new amigas have same
market share as milan.

>
> The Milan has none of those things going for it.

dis is advocacy. i'm an advocate fer atari. dat means razor have
comment 'bout tings. sincrap no like atari, tell big lies about it, an'
bigger ones 'bout apple - an he's certanly no friend of yer platform
either. razor just take sincrap down a coupla notches. yer welcome ta
put da boot ta me anytime ya want, me no take personal.

How would you know? Lots of folks who have had the old Performas plus
some 040's thrown in are making a home for the new iMacs such as the $799
one.

What marketshare? Again only in your mind. What a load of BS. The Milan
has no choice but having less than one percent of one tenth...if any at
all. So who developes for it?

> > Copland existed for developers...Is that the best you can do? Copland is

Copland has been put to pasture period...Get over it! Apple never hyped
Copland publicly...Only in your mind...In the meantime, how mant Apple
product families have been created since 1995? Compared to the progress
of the Milan II? whats so difficult to bring out stinky beige box? Are
the folks behind it incompetent?

> really, is dat da best ya can do, sincrap? i can pull a bettah

You must be still stuck in the classic days...Have you paid attention
lately. Apple does have software that has no peers in the wintel land
such as iMovie, Final Cut Pro, QTVR, QT, Web Objects, Sherlock,
AppleScript and the list goes on. Plus OS X, which is bringing in the
shareware folks from Unix and linux land..Apple is doing fine thank you..
Q4 is tends to be a challenge due to product line change overs...Sales
were up by $500 million plus over the same period last year...

Your an idiot. Most fianacial analysists don't understand Apple and have
been burned many times in the past...Remember three years ago when most
stated that Apple would not exist pass 2000?

> >They are primarily selling into their installed base and are not

> sincrap, who make things up.)

Some one who has been gone for 8 years is hardly anything new...According to Mitch Mandich, Apple is selective on who they will partner with at retail. They have turned many away who banged on their door.

> "Steve Jobs has done a good job of selling, and the Apple interface is
> still superior, but he doesn't have critical mass," said Tognazzini, who

Why concern yourself with the Apple market share when the Milan market share
is virtually zero?
If you consider the Apple misfortune of having a decent market share, decent
distribution and decent software availability, not to mention decent
performance (even if the OS sucks) , it's not looking to good for the Milan
from where I am sitting.

The Milan has none of those things going for it.

I don't like Mac's, but if you're going to bash Apple for it's market
performance it's somewhat hypocritical when your own platform has virtually
no marketshare to speak of.

Regards,

Clockmeister.

5579. crapple still beleagurd - RDF blow up in sincrap's face real good

I sure hope soo...When the financial types say nice things I get worry...The jinx factor. When bad press comes, I feel a sign of releif..Sort of reverse. This has been the saga of aapl.

> I think the thing that has REALLY triggered the current problems are

Or could it be that the new iBooks and iMac 350 did not ship until late into Sept to make an adverse impact on sales? Apple used Q4 to dry out the iBook channel according to reports...

What do you expect from Beta. There will be plenty of software at roll
out time by than. A lot of the Unix and Linux crowd have begun to develop
shareware.

Were are the dealers dropping like flies?
Mac magazines in general have not gotten thinner except for

MacWorld..Thats due to their own fault and the internet. MacAddict has
grown and so has MacHome.

Have you seen Computer Shopper and PC Magazine lately? Both weigh ounces
not pounds. That has to do with the changing market and the internet...

See macsurfer.com and get a clue!

sinclap,
you must try and control your anger.
i run my business with small compact code machines(atari)
apple used to be the same way.
the consumers that you say you know so well are not impressed with what they see, this is not a attack on apple, but constructive criticism.
if they were apple sales would not be tanking right now, and they are.
i am not gloating over this, i think that its bad for whats left of the real computer community.
if you do work at comp usa, or are a apple rep, you would be in real trouble right now, i have worked for some of the biggest retail corp.'s in the world, and you always listen to constructive criticism, and you do not answer people like you do.
i would never dream of doing what i have seen you do over the last couple of years, my boss would have found out sooner, or later(and that was before the net), and i would have been canned.
i now know for sure that you are either a adolescent, or very immature, you could not possibly be in the position that you claim, and i will find out, i have many friends in the computer industry in the mpls./st. paul area that i have met, and dealt with over the last 17 years that i have been in business, i know 2 very good apple people who are small dealers, but know just about every apple person in the 5 state area, plus wholesalers of software including apple who have sold to comp u.s.a. before.
i will find out if comp u.s.a., or apple would allow a person like you to terrorize a community of users who by the way might become, or are actual apple customers.

You're wasting your time on sinclap. The only real viable alternative to a
PC is an Apple product, even you should be able to acknowledge that much.

Any other alternative platform is just a hobby hack, not that that is a bad
thing though.

I love messing about with my Amigas, but I ain't no fool either...

Regards,

Clockmeister.

sinclap,
just the way you answered my last post proves what i am saying.
you are what i say you are, and your answers are predictable.
i am not threatening you, i just need to know who would put up with someone like you in the position that you say you are in.
i have seen bad management before, and you as a employee would fit that bill.
you are wrong about your own time being your time, it all depends on your behavior.
as far as losing the argument on the apple software, you cannot understand what i am saying(further proof of what you are), i am saying that i have seen it, just like many others have, and have not been that impressed. that is a problem for apple, not atari, or any other platform.
this is becoming a good exercise on how to try to reason with a adolescent.

The truth is, boy, Apple is experience the difficulty as a direct result of the Macworld announcements.. i.e., dual processor macs and the cube.

Nobody is buying the dual processor macs.. it was a huge mistake to release them before a multiprocessor OS is available. Even the "evangelists" must realize this.. people aren't going to upgrade their Macs until they know more about Apple's long term plan for multiprocessor support, and until they see progress with OSX.

The cube is interesting, but in real analysis, kind of stupid.. I don't see Imac users buying one, because it's more complex to set up.. and I don't see power users buying it because there's no slots! Mistake..

They should have expected there'd really be no way to pull things out until they can get faster G4 chips. People are not going to upgrade until either the OS offers true multiprocessor support or faster single processors.

Yes, Apple's problems are probably temporary.... but they do have problems... and I don't expect you to be honest enough to admit Apple's big mistakes this time around because you're an empty-headed Jobs cheerleader.

I disagree on the DP G4 sales...The DP G4's come with the photoshop plug
in that doubles the speed. A G4/500/DP with photoshop will give you
speeds upto 2 GHZ PIII speed.

The plugins are scarce, but the top tiers will support the DP.

5596. talked to my first apple dealer today

Newsgroup: comp.sys.atari.advocacy
Date: 2000-10-05 00:00:00 UTC
From: Video61@webtv.net
Message-ID: <24707-39DD237E-17@storefull-176.iap.bryant.webtv.net>
Source record: 1461

as the header goes i talked to my first dealer friend today that agree's with me.
apple has not got much software out there, people love games, they want apple specific stuff.
he counted 144 customers last week at his both looking for iMAC specific games, or software, and everyone of them cursed there kids for talking them into a iMAC, when the parents wanted a PC.
does this sound familar atari dealers/users? you bet.
this will only get worse for apple, the need for software is now, the hardware is already here.
apple cannot do this by themselves.
large companies will make there most popular applications for apple, but its only there biggest sellers that they will do, and maybe just a bloated bug ridden PC portovers, all of the other goodies that people drool over also, but are not mega sellers will be PC only.
does this sound famlar atari dealers/users? you bet.
then once the market is so small that even the mega hits fizzle, bye bye apple.
does this sound familar atari dealers/users, you bet.
the surest way for them to survive is for 2 other nitch motorolla machines to thrive, thus getting all sorts of small software developers who know the unique hardware coding.
jewels will surface, thus saving all, if not, so long apple.
he is doing a show this week, i may help out just to see a couple of other dealers that i know, and to gage this first hand.
if i do work the show, and met the other dealers, i will post my results.
thanks,
lance

You just don't get it! People aren't upgrading because most people don't get any real benefit out of MP machines right now.

Don't forget, you can't have it both ways.. Apple has been neglecting power Graphics/Video/Audio users for a long time, becoming a consumer computer company.. now the only people who can get any use out of the MP machines are power users?

Don't you see the obvious problem here?

> Sums up my opinion. Pricing and proper positioning will fix it..

Maybe, maybe not... I just don't see a market for that machine myself unless they come out with a PCI expander box. Come on, Apple SUBSTANCE please..

Apple reputation for hardware compatibility takes a nosedive

http://www.appleturns.com/#1

Keying with the enemy

Adding insult to injury is never a nice thing to do, even if the injury in question is really small. Did we say "small"? Make that "tiny." Personally, we never understood all the hubbub about how the four new keys on Apple's Pro Keyboard-- Volume Up, Volume Down, Mute, and Media Eject-- don't work on older Macs. Isn't something like that to be expected? In any event, some people made a big deal about it, including Apple. The company actually cancelled people's orders for the shiny new input device just because those four nifty-but-hardly-crucial keys were nonfunctional on all but the very latest Macs. Funny, we'd have thought that most people who ordered the Pro Keyboard did so to get a full set of standard keys, including a keypad and full-height cursor and function keys. Did anyone really buy one for the one-key Mute function?

In any case, here's where the "insult" part comes into play: according to MacWindows, if you hook up one of those Pro Keyboards to a USB-equipped PC running Windows 98 Second Edition, three of those four special keys work. Think about that for a second. Your Strawberry iMac DV? No go. That single-processor Power Mac G4/500 you bought in June? Out of luck. But plug your Pro Keyboard into some Dell or Compaq box which isn't even running the very latest operating system out of Redmond, and suddenly you can Volume Up, Volume Down, and Mute 'til your fingers bleed.

Dell has blamed Europe for the short fall.

I have not bought the stock yet. I am waiting for an $18 price. Maybe it
won't fall that low. But that is my price to acummulate.

I am looking at Earthlink now which is below $8 from a high of $30.

>So what Apple dealer did you visit?

...as much as I hate agreeing with this raving lunatic, the
software scene for teh Macs isn't quite that dire. Plus,
those comments all sounded extraordinarily vague.

Besides, if you can afford to buy a Mac: getting another cheap
PC to just "be compatible" should actually be quite trivial.
Serious 3D gaming isn't cheap, but the rest pretty much is.

i actually visited a friend of mine that wholesales apple software, as well as the PC. he only does direct sales a couple of times a year for very large computer shows, otherwise its strictly wholesale to dealers.his apple market has been shrinking dramatically this year, and it does not look good.
he used to wholesale atari, and commodore software also, he dropped out of them 10 years ago, and he said that the apple market know looks like the atari/commodore markets 10 years ago.
he is very careful on what he buys as far as apple is concerned, he does not want to take a bath in a liquidation type of scenario, like he did with atari/commodore.
we both have been in the computer market so long, that we share the same fears for apple, for we have seen this before.
no matter how fierce your loyalty is for apple, it will do no good unless the motorolla style platforms expand.
you need good coders who know the architecture, not port over PC hacks.

jedi,
what i mean is real software written for the apple.
how can you win over customers with the same stuff as the PC?
if you use the same software, and it looks the same, and loads in the
same time, why not by the cheap PC that you say to do.
stop into any large software dealer, and browse the store for PC
software, its everywhere, and its cheap, now look for the apple stuff.
so run it on a apple with a emulator then, doh!
just buy the cheap PC!
atari/commodore users love there machines for certain specific
applications that work very well for them without the hassle of a PC,
other wise they would have moved on long ago.
i am not saying that there is nothing for apple, it is just so small
that its starting to resemble the atari/commodore market 10 yeas ago.
history is there for the looking, ignore it, and it bites.
thanks,
lance

Apples are remarkably better controlled and engineered
product. They always have been. Even on Zdnet you can
see a large number of complaints about how Win9x handles
USB. Whereas with NT5 you may be lucky if your USB device
even has an available driver.

This comes from being engineered from the ground up for end
users rather than being something slapped together to keep
Apple II's from getting to0 popular, that is then patched
over and over again but only done so in the absolute laziest
fashion possible while barely avoiding mass defections.

>if you use the same software, and it looks the same, and loads in the
>same time, why not by the cheap PC that you say to do.

Quite often with PC's you get what you pay for.

This is the voice of experience from the PC builder's trenches.

[deletia]

I don't bother with Windows anymore because of those sorts
of problems. Were Apples more reasonably priced at the
critical moment in time, I and quite a few others would have
never even bothered with what are essentially "random
collections of spare parts".

Being able to "run everything" ceases to be a compelling reason
to bother with kludge klones after a time. You realize that you
only need to "run enough" and that the mindless Lemmings don't
tend to make exercizing free choice easy anyways.

i will look for that in sundays paper.
comp u.s.a. has a fine apple selection, i agree.
but the real problem is you need that in many stores, not just one
chain.
i was in best buy yesterday, apple stuff was very dismal.
when apple gets this stuff out into many store fronts it will look
better for there survival.
right now its a nitch item for some stores.
most people will only buy stuff thats widely availible.
apple has the hardware base already, what they really need is to bolster
software, hardware sales will follow.
its like swimming up stream selling non PC hardware with a lack of
software, or outlets that sell it, i know, i have done it for 17 years.
i got so fed up, that i decided to produce my own.

jedi,
you seem to be missing the point, i am not attacking apple, i do not like the PC,
it is not a real computer, it is a calculator emulating a computer thru software.
but the lemmings that you point out to me need something more to push them over to apple.
i think the apple is a great machine, i like my sons G4. but you cannot say to people that apple is superior"see there awesome architicure" when it is running PC bloatware, or PC bloatware portovers, they do not care, i know, i have sold computers for 17 years, people want software, lots of it.
if your platform does not have what i want, and it takes alot to get it to run, then why should i buy yours, when i can have theres with all of the goodies.
you can tell me how great your stuff is, but where is the different software(in abundance) that shows me.
i heard it from about 1989 till today.
you cannot change people, you cannot change history, you cannot call them dumb(even if they are), the failure lies with the producers of the platform.
remember power without the price, big deal, how about some software, lots of it, really showing off the arciticture.
thanks,
lance

You could argue that the selection and variety of Apple software on
display at retail store fronts has been dismal for more than ten years in
comparison to the wintel selection. There are areas of improvement.

However, CompUSA as a nationwide chain has the best selection of Mac
software, plus many hybrid titles.. Installing a game on a mac is far
superior than installing one on a PC due to the undescipline of the PC
organ bank due to compatibility issues.

There will be a new super computer store thats having a grand opening this
weekend in mn called Micro Center. Look for the ad circular in the Star
Tribune. They have the Apple show room dept with the wide assortment of
Apple software on display. Even have Web Objects and FCP..

True, but with the advent of a new store that has a Apple show room will
improve the selection variety in mn. The ad circular for the grand
opening came out on Thursday I believe. There was a full page on Friday
in the Star Tribune as well.

There's an interview with the Utah Saints up on http://www.icrunch.com at the moment and among other things, the Utahs talk about why they've stuck with Atari computers at the heart of their music studio. Quite interesting reading.

"Power To The Beats", the damn heavy new Utah Saints record with a sample of "Enter Sandman" by Metallica plus a guest vocal by Chuck D of Public Enemy, was released yesterday (October 9th) in the UK. As well as being available on CD and 12", it's also available for "digital download" from www.icrunch.com- worth a listen.

Stuart.

Yes, the stock crashed. I view it as a buying opportunity because the
stock is cheap compared to their strong fundementals. The company has a
strong balance sheet with $3.8 billion in cash and just $300 million in
longterm debt. The current market cap is around $7.3 billion. Apple
could use it's cash to buy back half it's stock if it wanted to do. The
stock has bottomed at $21 which is $3 more than I wanted it to be take
advantage of my greed windfall..

Let's see.. I know about 15 people who work for Apple including two people on my hockey team, their headquarters are ten minutes from me, I've even interviewed there.

Now.. you can be "closer to the scene" if you want to. All I know is, the people I know who work at Apple pretty much agree with me, and recognize the problem.. except for one gentlemen who is a "true believer evangelist." The rest are regular people.

Hey Razor,

thats pretty ingenious using one pompous blowhard loser to deflate another. Too bad Dereks powerpc emulator is shelved. but I'm not surprised in his 13 years of writing emulators he never did produce one that worked. Thats right the first version of xformer was an apple II emulator he tried to peddle to computes atari mag which they rightly refused to publish. Not that I blame them, it contained pirated OS roms from apple, and on the few occasions it actually ran it turned an 8mhz ST into a 0.25mhz apple II, when a real apple ran at 2mhz minimum. Don't be foolled by Dereks bollocks though, his emulator of powerpcs is shelved for only one reason. He's a lousy programmer, and simply can't produce an emulator that can't even meet his own low standards.

The only point is your anecdote is no more "valid" than mine.. and thus, you are no "closer" to it than I am.

You have been in denial over this for a long time, and have consistently shown your lack of understanding of Apple's key markets. No offense, but I think you're wrong here too.

Pretending Apple doesn't have problems won't make them go away. Smart people address those problems instead of ignoring them. You can't address the problem until you admit there is one. Apple's numbers PROOVE there is one. You can crow all you want about Dell's numbers, or whoever else's numbers, but the fact remains that the quarter where Apple releases new models has usually meant pretty good numbers from them in recent history.. get the point? The market may be down, but Apple's current problems are deeper than the market.

Releasing a multiprocessor computer without having an OS ready? Silly..

Besides, Apple got people all hot and bothered about multiprocessing before with the 9500/180MP.. and how many apps actually took advantage of that 2nd processor? Once bitten, twice shy, buddy..

Are we talking about Apple's G4 sales or missing their financial target?
Apple has stated that the shortfall is due to the G4 Cube(I have issues
with it too) and not meeting their education numbers. One could argue
that the missed targets are due to shipping the products late in the
quarter. Apple did not ship their new iBooks and the $799 iMac 350 until
well into September which may have been to late to drive revenues.

> Pretending Apple doesn't have problems won't make them go away. Smart people

So, Apple's multiprocessor G4 caused their shortfall?

> Besides, Apple got people all hot and bothered about multiprocessing

> bitten, twice shy, buddy..

So adding a second processor, GB ethernet and bumping up the HD for the
same price as the previous line is a problem? Granted that only a handful
of products takes advantage of the second processor is not the cause of
the sales shortfall. Apple publicly blamed the G4 Cube which did not ship

into volume until September.

We're talking about both.. I know what they said, and yes the Cube is responsible for part of it.

> So, Apple's multiprocessor G4 caused their shortfall?

Contributed to it significantly, yes. Upgraders didn't bite for the most part.. and neither have new Mac users.

> of products takes advantage of the second processor is not the cause of
> the sales shortfall. Apple publicly blamed the G4 Cube which did not ship
> into volume until September.

You're missing the obvious here.. it might have been the same prices, but sales numbers didn't increase much at those same pricing the way they would have had Apple been able to deliver a 700mhz G4. Nobody cares about GB ethernet, at least not yet.

Again, people didn't bite on the Cube, but also people just aren't all that excited about dual processor machines where that 2nd processor is mostly idle.. it's not hard to understand why.

Once OSX comes out, if it's stable and utilizes that 2nd processor for OS level operations, THEN multiprocessing makes sense and probably WILL help drive sales. Not yet...

I'm still a bit annoyed at Apple for neglecting pro audio/video/multimedia users for so long by not giving us six slots. They've lost a lot of ground they used to OWN in the process. With a couple of exceptions, USB still isn't generally as good as serial for MIDI. Now, firewire audio cards have been announced (not shipping for several months), so maybe, once we find out how well they work, the point is SOMEWHAT moot... but damage has been done. The question I have is not whether they

can get people back.. they can get SOME or even MOST people back is my guess.. the question is whether or not Apple CARES to even try. I hope they'll make an effort to display their commitment to the NON consumer market.

The only thing I did not like about Derek was the way he cut down the Atari
ST, yet he expected to make a living selling an emulator of it.

Giving up on the Cube..

Well, after 15 years of loyalty to Apple, I've finally succumbed and
bought a Wintel box. Just two weeks ago I bought the Cube. The next day
it was returned because it would spontaneously turn itself off and start
on/off cycling (I see that others have reported this problem as well).
I received a new Cube and 1 week and countless hours trying to figure
out why I couldn't connect using my DSL connection, I verified that the
Ethernet card was bad. Of course, you can't just replace the Ethernet
card in the Cube because it resides on the motherboard. This was the
last straw. For years I've been a Mac evangelist. I
love the way Apple is on the forefront with new designs and technology.
However, I'm tired of being a Mac person in a Wintel world. I'm tired of
always having to think of a "work around" to be compatible with the
majority. I'm tired of hearing about software that could improve my
productivity only being available for Windows. In short, I need to get
my work done and not have to worry about random problems and
compatibility issues! I hate not having reliable tech support and
service to deal with problems should they arise. If
the problems with the Cube had popped up months from now, my only
recourse would have been to ship the Cube to Apple for repairs and be
down for God knows how long.

So...I returned the Cube and purchased my very first Wintel box. On
the one hand, I'm very sad that, for the first time in 15 years, I no
longer own a Mac. On the other, I'm relieved and excited to know that
I'm fully compatible with the majority of the users out there, as well
as my platform at work. I certainly am not passing judgement on the
loyal Mac crowd out there. Its just that, for me, I was wasting too much
time trying to work on the Mac platform.

Highlight....

We ask for your understanding for the fact that we decided us not to
produce an outdated hardware standard in the long run but the
expenditure on capital assets amounts to some million German Marks.

sinclap spin: Oh duh!

Hi all,

here you are:

"Kiel, the 10,10,2000

statement to the Milan II

Weeks and months it was quite calm almost around the Milan II. Last
large appearance and associated, official messages took place on
the Atari fair in June in Neuss.

Meanwhile many Milan fans are however in unrest guessed/advised,
because they do not receive acknowledgements for the well-known
erscheinungstermine of the Milan. Long time lasted it, until we
could take position from the company Milan officially for current
situation.
However the reason is that we did not want to publish wrong
information, up to the day of yesterday (09.10.2000) no unique decision
had
met.

The Milan II

The targets of the Milan system were clearly outlined: It had a new
board Design on base of the Milan I ago, which continues proven
items in addition, brings substantial improvements with itself. So
e.g. a AGP port or also the support of SDRAMs.

In the spring this yearly was again revised when desired the selling
partner, which always transmitted an estimation market chances of
the Milan to the computer enterprise, the concept. In order to go to
any dependencies on driver manufacturers for diagram cards and
sound cards out of the way and besides the Milan II in a compact
housing to under-get be able, became decided, to integrate the
components for diagram and sound on the Motherboard.

A first prototype of the Milan 060 was to be seen on the fair in Neuss.

Against expecting technical problems in-crept again and again, for whose purpose even additional hardware designers were engaged. The integration in particular the AGP port, in addition, the SDRAMs prepared hardware-technically under-waited difficulties, which could be solved however after viscous advancing in the late summer 2000. Just in this moment occurred what had to occur:

The manufacturer one of the two important log IC chips of the Milan (he takes over the complete emulation of the not existing Atari hardware) was adjusted despite contrary promises on the part of the manufacturer and is available neither in smaller numbers of items than remainder nor in large numbers of items than special production.

A shock for the Milan team, because a scarce year work was in this chip. An adequate, counterpart existed at the market, which can be adapted fast, dezeit not or could not be found yet.

Together with the selling company AXRO the situation in the late summer 2000 was discussed. Together with our distribution and interlocutor it came to the result that a small computer company, which does not manufacture quantities in hundred-out one hundred and abverkauft this problem could flower on a long-term basis again and again. And first considerations for adjustment the project were discussed in addition, put fast again ad acta!

The new OS

In this moment a project was drawn from the developer drawer, which Uwe cutter, Ali Goukassian, Michael rockers and Thomas Goettsch had already prepared in November 1999 and had conceptionally held. It should be implemented actually only in one of the
future stages of hardware production, in order to save time.

The speech is from a new operating system concept, which almost hardware independent a Atari TOS or a MagiC Milan could make thereby.

The new Milan OS, which differs technically far from the Atari TOS, because many areas of programming were structured new, is simply expressed structured as follows:

It consists of a depending on hardware and an independent layer. This step had to be carried out, in order to bring Atari programs on the new Milan hardware to running.

While the independent layer takes up the instruction e.g. for the access to sound, diagram or fixed disk, this instruction is interpreted and
the depending on hardware layer, which transfers the actual access

then transferred.

Thus it should be ensured that easy modifications in the hardware (Milan I - > Milan II) at few expenditure to be adapted can.

MagiC Milan again was changed so much opposite the standard designs the fact that it does not make any own access more on the Milan hardware but transfers its ﬠWuensche " to the hardware to the Milan TOS. This step made the MagiC Millan development again independent of the Milan hardware.

The new operating system concept designates now a step, which was already initiated in similar courses by Apple with the new MacOS X or by Amiga Inc. for the new Betriebssytem (project name Elate):

Depending on hardware sections of the operating system Milan TOS by our developers against a Linux core one exchanges at present. This part of the operating system is not under any circumstances Atari typsch, but serves excluding the interpretation of the hardware accesses on the part of the operating system or the software.

Linux, a Unix derivative, is Freeware and by hundred-from one hundred of programmers is as well known developed further.

And Linux is today so far established that drivers for the access to USB interfaces, fixed disks, are Firewire interfaces, network cards etc. always briefly after appearance of the respective hardware or hardware standard available.

For the Milan crew it had meant in the past to develop drivers e.g. at all for responding the Milan USB port.

Owing to the new concept the Linux core is embodied however with the independent part of the Milan TOS. Places the Milan TOS or the software, which runs under it, a request of an interface, this is transferred over a standardized interpreter to the Linux core, which is at the
edge mentioned also only a few KB large. This again already has all necessary drivers, which are world-wide freely available, in order to tie up any modern hardware (- standard) to the TOS.

Perspectives

The perspectives look today on the one hand well, on the other hand disappointing: The Milan II was put on ice. Months-long work, which swallowed thousands of D-mark is likewise triumphs, like the hope of many Atari users to be able to call a fast Milan II already soon their own. This is to be charged primarily to technical problems. In addition, beyond that the months-long is tried to also draw venture Capital
societies (holding companies) from Germany in the boat in order to supplement the capital clearly, failed. In this country ones become at present primarily InterNet air things, which do not create anything

within shortest time from that a fictitious million-value, which falls mostly however evenly so fast again into the depths, supported and from the baptism elevated. One that really few enterprises, which has to offer computer know-how and its own, small and operating system equipped with much software, however unfortunately saves the large risk, costs for the investors by materials production (Main board etc..) to cause.

But this means the end of the project with nieces. Milan computer system will offer, to all that, which would like today a Milan further the
Milan I with 040er-Prozessor. And also the Upgrade card on the 060-Prozessor are to be had further and meanwhile. In fact at present thus nothing stands to the possession of a Milan with 060-Prozessor in the way.

The step, which is now done, is to be looked toward Milan III. And but at present two scenarios are to the selection, which build all together on the fact that the Milan TOS (and thus the essay MagiC Milan) already soon it is almost hardware independent could:

a.One decides for an Linux core adjustment on e.g. AMD hardware (Athlon, Duron) and standard board peripheral device. In the course its is selected a board, which imports only in this country be acquired must. Conditions are fulfilled like a large Flash EPROM. This can be still a TOS based computer, which starts directly from the chip. The arithmetic performance would grow with this solution proportionally to the assigned processor and with a 400MHz-Chip the performance of a 060-Prozessors very far would already exceed.
b.One begins (if necessary own) a PPC G3/G4-Board, which is still closer to the 68060-Prozessor, so that starting from 350 MHz more than one doubling of the arithmetic performance was achieved here.

So that the TOS runs also under these processors, a 68k-Interpreter is integrated, which runs differently than Windows or MacOS based emulation, independently natively and a high arithmetic performance enabled.

For version b) a license partner was opened at present, which would sell 2001 maximummodern G3-PPC-Boards toward start to manufacture and as OEM product at Milan. Here it would be ensured that the computer altogether approximately 1700, - DM would cost. The negotiations run at present. The partner would not like to be called before contract drawing. Clear it is however that specifications were likewise kept such as diagram and sound on a min in OTHER board, like now even the binding of a network adapter and a bus clock of 100MHz.

The perspectives, which would offer one from the NOT already promptly transferred to implementing, are enormous:

The entire operating system will be still smaller approximately 2 MT and could be operated on processors such as AMD, Intel, PPC in addition, RISC, Aplha and Thosiba at a comparatively small expenditure.

Thus the Milan TOS with MagiC Milan becomes in nu one of the smallest, portable operating systems, with which the software (differently
than e.g. with Windows CE) does not have again to be compiled, in order to run on different processors.

First versions of this new operating system symbiosis already had to be seen in October.

Result

Their confidence, dear customers, surely shrank in the course of the time, because you had to wait for a long time for an not appearing device. But a reproach, which one cannot make for Milan of computer system is that that in this house the things were not finished. Because as only manufacturers Milan of computer system succeeded in bringing an executable 040/060-Computer to the price eligible for financing in circulation. With this step Milan succeeded in proving that here uncoordinated technique Freaks at working is not only, but
that concepts and clear lines can be transferred also up to ready for the market ones.

Herein the enterprise differs from numerous companies, which let intelligent and talentierte headings operate senselessly for many years, without supplying results.

The Linux core idea, which trusted to transfer itself the team not promptly to be in order not to stop the Milan II according to schedule, seems the only load-carrying solution. It nevertheless gave always considers, whether could succeed, a 80MHz-Computer to intersperse and also whether it would be enough to use a main processor become outdated technologically hopelessly as the 68060.

These concerns are extinguished with an impact. The Milan could live on already soon on efficient platforms and let the operating system on competitive hardware, loved by us, continue.

In particular the perspective to receive G3/G4-Boards wakes nevertheless many hopes, because such a computer would not only underline the breath of the non-standard one - it would arouse world-wide much interest.

And this way seems also economical to be more lucrative, because nevertheless now no hardware production connected with high risks must be carried. The developers can itself on an area - the operating system - concentrate. And so it is only one question of the time, until
the new Milan III can be on our desks.

Realistic estimates to the consequence this ?t until 2nd quarter
2001 the case could be. But as said: Then as super modern hardware.

And up to then there are the Milan I - 060 for all those, which
would not like to do already today without speed.

We ask for your understanding for the fact that we decided us not to
produce an outdated hardware standard in the long run but the
expenditure on capital assets amounts to some million German Marks.
And even if you, dear Atari fans and we know that 80MHz are
sufficient, in order Atari software with highest speed to operate -
one will be able to put this not close to the mass of the computer
people.

If one intersperses the Milan TOS (project name TOS 6) in the future
however as ?Easy Computing Environment " - thus a working
environment for simple computers which can be served -, in which it
runs on some platforms. Additionally now also still another its own
reference hardware on base of a non-standard power PC system offers,
then one has a real chance by the world public of the
computer-interested users and media to be considered. We could learn
that in the course of the passed months.

In the future we will inform you - there we now the route of march
of the Milan know - again regularly about the events both in the
InterNet
and about the publications.

Its Ali Goukassian and the Milan team "

Bob King.

In Reply to: Re: Attention Carlton Sheets Graduates! posted by Dave on September 7, 2000 at 09:39:07:

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY.

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:

: READING THIS COULD CHANGE YOUR LIFE! IT DOES WORK!

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you

: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1) Steve Wehvila
: 3155 Vernon St.
: Duluth, MN 55806

: #2) Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #3) Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #4) Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #5) David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #6) Webster Lessard
254 Clarks Mills Rd.
Hollis, Maine 04042

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and

: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that

: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

i worked for a friend of mine this weekend who is a wholesaler of pc, and apple software at a show that was done at the mn. state fair.
there was not one piece of apple hardware there, last year there was a few.
there was one apple software dealer there who i have met before(none of the rest showed up), and i asked how it was going, and he said that the apple market is doing ok, nothing great, but that he was buying, and selling pc software now.
that brings to my mind the pathitic state that atari was in by the early 90's.
here was a company that at one time had the second largest software producer, and distributer in the world(atarisoft).
then a mere 6 years later was relying on mac, and pc software for there last machine produced.
who cares about your machine then, why not buy a cheap pc, what users want is software that is unique to the architicture of the machine, not a second hand bloated bug ridden piece of pc junk.
i think apple should really be more involved in real production of software for there machines before its to late.
there is just a blizzaerd of pc software, it was even cheaper than last year, i saw hundreds of titles going for $3.00 or less with copyrights on the boxes 2000,1999,1998, so it was all current stuff.
there was over 50 dealers there, and only one apple dealer left.
apple has no wiggle room anymore for mistakes, the pc world is junk, i agree, but its everywhere, and its current, and its cheap.
the apple is about to become a hobby machine, and that would be a crime, because then no one produces software that can be kept current, just ask any atari dealer/user, or commodore dealer/user.

Uh, maybe Apple users hold onto their hardware much longer. Or could it
be due to eBay?

> there was one apple software dealer there who i have met before(none of

Ever hear of mailorder? I must get upto 10+ catalogs per month from Mac
Mall, MacConnection, MacWarehouse, Club Mac etc...

Did you check with CompUSA and First Tech?

> that brings to my mind the pathitic state that atari was in by the

Don't compare Atari to Apple...Not even close. I suggest you visit the
Twin Cities and visit the likes of Micro Center and the CompUSA's...

Have you ever installed PC software on a beige box? You might want to
check out http://www.AmbrosiaSW.com/news/

Junk that could not survive on full retail price. I think that is an
advantage..

> there was over 50 dealers there, and only one apple dealer left.

Your point? Maybe that people keep their old macs when they upgrade to new ones. I have observed this...

> apple has no wiggle room anymore for mistakes, the pc world is junk, i
> agree, but its everywhere, and its current, and its cheap.

I have heard this for the past twenty years...

> the apple is about to become a hobby machine, and that would be a

You need to visit the Twin Cities...No such thing as a specific hobby machine anymore...

sinclap!

ah but i do visit the twin cities, i live just 20 minutes from downtown mpls./st.paul.
i am a mail order house for atari products, so i am quite aware of how mail order works, and how people would rather browse, and pay right on the spot for software.
i am not so sure that the software at the show was junk, having been in the business for 17 years, i recognized many of the software companies that put out the software that i saw, and it was plentifully, and cheap.
what i am trying to say is that the world is flooded with cheap(pricewise) pc software, and a lot of it is good enough quality to make the average consumer happy at a buck a pop.
shows like that are done every where all of the time, it used to be that you could find other platforms, and software, but not today.
my point is that apple is swimming in a uphill battle with higher prices, and simply cannot do it on there own, and its beginning to show.
a few stores carrying apple software is nice, but when your neighbor comes home with $50.00 worth of software, and his kids have to help him get all in the door, and you paid that for one piece of apple software, get my drift.
maybe apple should be happy if they could have some small clone platforms to get more software development, its either that, or die.
the PC is a giant freight train that cannot be stopped, and will roll over everything by just sheer numbers alone, apple needs some help.

dat's funny - charging state tax fer a d.e.s.c.r.a.m.b.l.e.r. dat's i.l.l.e.g.a.l. ! razor sure other acronyms like f.b.i. an' i.r.s. wanna know more 'bout c.r.o.o.k. , put der b.u.m. in j.a.i.l.

5643. Need help with Atari Jaguar

Newsgroup: comp.sys.atari.advocacy
Date: 2000-10-19 22:58:08 UTC
From: Chris <capw@the-wire.com>
Message-ID: <39EF7C80.EC71C1A1@the-wire.com>
Source record: 1408

Hi,

I just won a bid recently on an Atari Jaguar and just received it in the
mail today.
The box was never opened... factory sealed with a holographic sticker.
Anyway, there was no manual.
Since a game cartridge is NOT inserted into the Jaguar, it won't power
on right?
I don't have any game cartridges yet for it. I've set it up and and
when I power it on, the light will not come on. Is this normal?

Any help would be greatly appreciated.

Thanks,
g'day

Hi

The Jaguar won't power up unless a cartridge is inserted, and that's
it's inserted correctly. Brilliant idea I wish other console followed:)

The timing was not good..

> > Finally, $30 million of
> > the shortfall was attributed to sales of the G4 tower focusing heavily on
> > the low-end, 400MHz model, rather than the new multiprocessor models.

Yea...the G4/400 is popular. Overall sales were up 40% from last years.

> > The focus for the short term, both Jobs and Anderson said, is to clear
> > the channel of existing inventory. Jobs warned that this approach would
> > lead to "two disappinting, but profitable quarters."

Smart move. Since the Cube rebate Club Mac has announced sales gains...

> result: crapple stock go kerplunk. razor see jobs on quicktime, it

I don't really see any reason to ressurect the ST. The OS hasn't changed in years, and nobody is writing new software for it. The "new" Amiga is under development, and I see it failing for the same reasons.

If you do have the resources to build a Power PC based 1040ST, why not use them to build a totally new computer for the 21st century? Let's leave these old computers in the dust and build something that can topple the wintel empire.

How about an ATX board with up to four 1GHz G4 processors, six PCI slots and one 2x AGP slot, and all the latest goodies that are on PC motherboards, along with a G4 version of Linux?

jared,
it ain't gonna happen.
i like all atari computers, i and others have looked into doing this,
its just to expensive in the u.s.a.
the market here is to fragmented, and everything is peecee.
the market here is a cattle market, like all markets in the u.s.a., we
have little or no free thinkers here, plus jack the idiot let it slide
thru his greedy greasy fingers, atari actualy had a name before he came
along.
i get calls all of the time from people who come across
st's,tt's,falcons's,XEGM'S lynx's, portfollio's, jaguar's, and they want
to know when they came out because when they bought there 2600, they did
not see those units in the stores and they know that atari went out of
business in 1984.
if a clone company from europe was smart though, they would market
there clones in english here in the us/canadian market, there would be
some sales, not all people in the u.s.a. are cattle, and many business's
still use atari technology.
that would help there bottom line to keep developing tos hardware, and
to avoid debacles like the milan II, that was handled in true jack form.
i want a true multi-processor machine that does not require all data to
be sent to some monster power hungry processor that is really not
designed to to any more than add, and subtract, and lock up from monster
bloated code,
thanks,
lance

funny sincrap - as well as spellin' problems, it obvious ya cant read
either

first - how can g4 cube be shippin' over a year, when it only
announced at macworld last july, an' only started shippin' in septmbr?

secund, jobs announce CHEAP cube in press conferennce, an' he make
clear it won' be released til' later. razor read an' see dis on quiktime
at dan's place - howcom sincrap miss dis?

chokin' his chicken ta pictur of cube.

5661. Atari questionaire...

Newsgroup: comp.sys.atari.advocacy
Date: 2000-10-29 04:57:54 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <g7OK5.306$z93.43693@news.goodnet.com>
Source record: 1426

Anyways, some (purely hypothetical) questions:

1) *IF* such a computer, with the specs I list below, were to be released... by Atari, mind you.... would you buy one, provided that you could run (at least) old ST software on it?

a) 1040ST and/or Mega ST case
b) 32-64Mb of RAM
c) ATI accelerated 3D video chipset
d) Yamaha XG audio chipset

2) If that unit came in two models; the 1040ST-styled one being less powerful than the Mega ST model, which would you buy?

a) Home
b) Business

3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for the Mega ST model? If not, what would you be willing to pay for either?

3) If Atari, as a computer manufacturer, returned, would you be excited and tell others?

Please, no smart-ass remarks or non-serious replies. I am planning on compiling the number of users that reply positively to this post and I'll post this message to other Atari newsgroups and elsewhere to see just how many people are out there that *would* be willing to buy such a system. No need to repeat reply if you visit more than one newsgroup this message is at.

If you know people that might be interested, show them this message and let me know if they are. I'll add their numbers to the list. I want to see just how worthwhile my idea is to the general Atarian/non-Atarian Internet public.

Thank you for your time...

Jared

<de-lurk>

Oh wow!

I can't believe it..

Almost 6 years since I first came into this newsgroup to read about
atari products, I stumble across a posting by sinclap.

I CAN'T BELIEVE HE'S BEEN SQUATTING IN THE ATARI NEWSGROUP FOR SIX
YEARS!!

All this, just to berate Atari stuff, or to somehow make himself
feel superior (?)

I suggest that you re-evaluate your life man, you've seriously
been wasting it down the tubes if your mission in life is to flame
people in comp.sys.atari.advocacy .. Think of all the meaningful
things you could've been doing instead, out there in the real
world..

<re-lurk>

>Anyways, some (purely hypothetical) questions:

Hypothetical in every sense of the word considering Atari as a computer devision doesn't even exist anymore.

>1) *IF* such a computer, with the specs I list below, were to be released...
>by Atari, mind you.... would you buy one, provided that you could run (at >least) old ST software on it?

No. Reason? a) The ST case design is horribly dated.
b) RAM is cheap, start at 64Mb
c) The ATI chipset is only average at best
d) Go with the industry standard, that being Soundblaster Live or similar.
>a) 1040ST and/or Mega ST case
>b) 32-64Mb of RAM
>c) ATI accelerated 3D video chipset
>d) Yamaha XG audio chipset

What processor more importantly?

>2) If that unit came in two models; the 1040ST-styled one being less >powerful than the Mega ST model, which would you buy?
>
>a) Home
>b) Business

I think I answered that already, neither.

>3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for
>the Mega ST model? If not, what would you be willing to pay for either?

Well, no more then the average PC, less then $500US certainly.

>3) If Atari, as a computer manufacturer, returned, would you be excited and >tell others?

It wouldn't excite me, especially based on your specs. I wouldn't tell too many people either, I don't like being laughed at.

>Please, no smart-ass remarks or non-serious replies. I am planning on >compiling the number of users that reply positively to this post and I'll >post this message to other Atari newsgroups and elsewhere to see just how >many people are out there that *would* be willing to buy such a system. So, are you going to treat all negative comments as non-serious and not include them in your survey? That would make for a somewhat biased survey wouldn't it?
In any case, just the Atari name isn't going to sell too many units, especially considering the less then impressive specs and price.

5665. Now for something... "exciting and new"

Newsgroup: comp.sys.atari.advocacy
Date: 2000-10-30 02:53:26 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <Eo5L5.389$z93.56201@news.goodnet.com>
Source record: 1430

You know, I had a relatively brilliant idea hit me today (provided it hasn't already been thought of or done). Instead of emulating ST hardware, why not make a PCI card that has the ST right on it! Not just the ROMs and/or one or two parts, but 95-100% of the ST's hardware on it!

If you look at a 1040ST, there's a LOT of wasted space. Especially considering today's technology and design. You can get circuit board traces down to a fraction of what they were in the old ST. And resistors/capacitors? They're microscopic surface mount devices now. Substitute the 2 or 6 ROMs for one ROM (or a tiny, surface mount Flash ROM, like PC's use today). For the RAM, use SDRAM chips, which are much higher density and surface mount also.

For the rest of the ST parts, take them out of old ST's! Unsolder 'em all! That CPU, GLUE, MMU, and stuff. Put them on the new PCI board. If I don't miss my guess, I would say the reduction of some part numbers/sizes and trace width should reduce the overal board size to a board you could put in a PCI slot.

In order that you could run this "ST card" on a PC or PowerPC motherboard, using a standard video card, you would probably be best to emulate the video shifter, so that you can run the ST in a window on your main OS. If you kept the real video shifter, you'd probably run into problems trying to get it to work with an SVGA monitor.

Now, since the "ST card" doesn't have any ports on it, you need to write software that translates or redirects the functions of the ST (like the sound chip for the printer port) to the appropriate hardware. You might even
emulate the floppy chip in order to use load/save files to and from your main hard drive or floppy drive, etc. You would create an ST Environmental Partition (STEP) file on your main HD, that the ST card used, thinking it was a MegaFile30 or whatever. Of course, you have to have a program that gives you access to the ST Card in the first place.

Now, assuming any of these is reasonable or feasible or worth pursuing at all, we port GEM or MiNT or whatever ST-derivitive OS to PowerPC (if we want to go that route) or Intel Pentium. In the case of Intel, we wouldn't have to port GEM at all... it's already there on that platform. We'd just continue to improve upon it until we felt it was worth calling "GEM2000" (or GEMillenium or whatever).

The ST would run at full speed. The hardware would satisfy *all* software, because it was genuine, not emulated. You could probably even run those copy
protected games on diskette (assuming you have any)!

Then, we take the opportunity to use the ST Card to port as many existing apps as possible to the new GEM (or whatever OS we go with) on the chosen processor. We have the best of both worlds!

We save money on parts, because we use existing parts from old STs. I was lucky to find a 1040ST for $5.00 at a thrift shop. The only question is... how much would it cost to produce the PCI PCBs and transfer the existing parts to them.

Any ideas if what I have just suggested is pure silliness or not? Seems at least a little more reasonable than my previous ideas... hmm?

Jared

Tankin? New word or slang? Lets see...Apple ships 570,000 iMacs, G4
Cubes/G4 Towers increased sales of the pro line by 10% over corresponding
quarter according to a Znet article...

sincrap not lookin' at whole picture at usual - amiga have history of
vapor project since CBM go down. atari clone makers have released many
machine since den. Milan I still bein' produced, hades still bein'
produced. sincrap predict many time dat milan an' hades get crushed by
amiga, no amiga appear, milan an' hades do well fer small companiy.

> > sincrap reveal he have brain fart - jus' like when he call ati cards

uh-uh, sincrap - ya claimed dat adobe had midi apps. sincrap try
changin' history. razor find it funny dat sincrap, known fer his poor
grammer an' spellin' would try ta crticize udder guys fer "lousy
editin'".

answer question, sincrap - no excuse, we no play dodgeball. when will vapor cheap cube an faster g4 be released?

current milan have '060 option available. ya can buy milan wit' 060, it no vapor. dis is global economy, ya can buy via mail order.

>
> > razor no call germany a rock. rock in sincrap's head.
>

hahahahaha! razor read much 'bout lousy service an' display at sears, mac user angry at idiot salesman. when razor go ta compusa on recent us trip, he not impressed wit' crapple section, it put in dark area. no employee on staff. very little softwrae. ya can see dust on imac. an' still, dere still many story I read 'bout mac users havin' ta make two hour trip ta buy imac. an' we all no what happen when sincrap brag when best buy become crapple dealer again, only ta have bb leave again. seems dey were right about worry dat imac wouldn' sell.

so, why crapple no get deal wit' company dat matter - like staples or business depot? like office depot?

sincrap want ta have tings handed ta him on silver plate. dose less whiny who like dere computer no afraid ta order by mail order.

> > not if dey cant move dem. dat why crapple in deep yogurt now.
> > sincrap
> > deny, jobs reveal, sincrap eat own spoor.

Quite. Something like the Mega would be a bit more
appropriate. Unless you need a box with a lot of
backplane cards, you don't really need anything larger.
Even PC's are starting to get down to that sizse.

> b) RAM is cheap, start at 64Mb

Plus, it is not openly documented. Something like
the Matrox G400 or Voodoo 3/5 would be much better
in this respect.

>How about an ATX board with up to four 1GHz G4 processors, six PCI slots and

That would be a tad expensive wouldn't it? Besides, you can barely
get multiple CPU 500Mhz G4 systems these day. A better approach might
be to use a higher degree of SMP with older and cheaper CPU's rather
than going for something that would end up being absurdly expensive.

[deletia]

Bang for the buck in silicon quickly degrades once you start getting
close to the bleeding edge. Case in point:

Athlon 900: $220
Athlon 1200: $575

>('twould be cool if we could use THEIR hardware product for OUR new
>PPC-based Atari. Depends on how open it will be. Probably not enough.)

Depends on what you believe of their bull****.

Me, I'm not exactly sure this will be an amiga, or even an amiga
clone. I'll have to wait and see, to tell the truth. WHat I've heard up
to this point though, is far from encouraging. First off, there will be
nearly zero transition from the old amiga, to the NG (this may have
changed, still trying to sort through all the PR crap). Second, they
insinuated before that hardware is unimportant, why try to make their
own when there are plenty of macs and PCs out there already (sound
familiar?).

In other words, they are too much a bunch of candy-assed faggots to
do anything real. Third their "DigitalEnviroment" isn't even an OS in
the traditional sense, but some bunch of PR-hype crap that isn't sure
whether it wants to an emulator foundation, to run windows and MacOS off
of, or a software package that emulates classic amiga on top of said
operating systems. Fourth, while it's commendable that they are trying
to off-the-shelf most of their reference platform parts, the specs lack
any sort of 'soul' in my opinion.

My conclusion: If any platform has won this pissing contest, it is you
guys and your atari. Both may be dead, but you got the last breath in,
and you managed to use it to laugh at amiga. The company masquerading as
"Amiga" is just some loser tech company that saw venture capital dry up,
and decided to buy a name with the last of it.

John

sometime late next year, huh?

interesting - let's hope that, for once, this proposed Amiga actually comes out. The Amiga market has a history of being disappointed with promises made but never kept, especially the vapour fiascos by Escom and Gateway. And you thought the Milan II situation was bad!

>
> Just interesting after the firestorm we've just been through on the
> same issue from an Atari viewpoint.

This is especially interesting because s*****p has been swearing up and down in .advocacy that the new Amiga is going to thoroughly crush the Atari market. Glad to have confirmation that right now the existance of this new Amiga for sale is quite a long ways off.

(oh, and by the way, if you want to see s*****p thoroughly sporked, check out .advocacy now, he's being clobbered in the wake of Apple's "speed bump", especially by TAF member John "Razor" Rikel. s*****p is in full denial mode, much like Cartman when he took the Weight Gain 4000 :))

>

You wanna talk expensive, you just TRY finding a modern Mac that costs $5,000. Well, when the 8500/120 and 9500/120 were around, they COST that much. And I bought them! If you think $1,500 is expensive for a Mac, compare the price to what PowMacs used to cost a few years ago and you'll see that Macs are downright CHEAP nowadays.

The new "Amigas" will not be based on the old Amiga technology.
In fact, it looks like they may not even run Amiga software, as was
originally thought.

PuLeaZE....Your calling the Milan cutting edge technology? The current
Amiga's are indeed yesteryear technology but available over the border in
Wisconsin. Were can I look at the Hades in the states?

They don't exist. 2 500 MHz CPUs do not equal 1 1000 MHz CPU, even if
applications are designed to use both of them. Some applications can do
just as well on two 500 MHz CPUs as they would on a single 1000 MHz CPU,
others will suffer from multiprocessing inefficiences (performance lost
either to thread synchronization or memory bus contention).

You are also wrong about the cost. The price of the standard dual-500 G4
configuration (256MB RAM, 40GB HD, DVD-RAM) is $3500. If you use the
Apple Store build-to-order options to strip the machine down to the
minimum configuration (64MB RAM, 20GB HD, DVD), it's $2500. (This is
worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB
HD and 256MB of 222 PC100 RAM, and most people don't need the DVD-RAM.)
Nowhere close to $5000 in either case.

If your applications are parallel enough, there's no good
reason that one can't be a very good approximation of the
other actually.

>applications are designed to use both of them. Some applications can do

Strip a machine that you'll need to run MacOS X down to a
mere 64M? Do you even actually follow Apple's technology
in even the most superficial manner?

>worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB
>HD and 256MB of 222 PC100 RAM, and most people don't need the DVD-RAM.)
>Nowhere close to $5000 in either case.

...at which point you're pretty much acting as your own VAR
PC style again. That somewhat undermines the whole point of
even bothering with a macintosh.

Besides, even in that configuration Apple comes out 2.5-3.5
times more expensive. This is the same condition that Apple
suffered from before.

Except now Intel based systems are actually on par or better
than the ~4x more expensive Apple systems.

These days, an Apple is pretty much an expensive PC with a PPC in it.

That was precisely the point I made. Not all applications are parallel
enough. You can't equate 1GHZ with 2x500MHz because the two aren't equal
-- there are and always will be fundamental and important differences.
How important depends on what your favorite applications are...

>>applications are designed to use both of them. Some applications can do

Sun gets lots of mileage out of multiple processors mainly because they
sell a lot of servers, where the workload is quite parallelizable.

You're deliberately trying to change the topic, in a most superficial
manner. The point was that Apple's machines don't cost $5K any more.

>>worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB

Don't try to troll me into an advocacy fight. I don't care what you want
to think about the value per dollar of Apple systems. You were simply
wrong about the absolute dollar amount, by quite a bit.

Those Macs certainly are 'cheap'. OTOH, similarly well put
together PC's are still less expensive.

dat not point - point bein' sincrap make big noise 'bout amiga when
he have no leg ta stand on. Current amiga he brag 'bout vapor, an' when
challenged ta show where ta find amiga fer sale, he mention computers
dat are gatherin' dust an' by his own admission use processor he call
junk. sincrap try ta wiggle out of hole he create, he just sink further
in it like hippo caught in molasses. if sincrap call milan junk, he have
ta admit same amiga he claim fer sale junk as well. if sincrap call
milan ii vapor, he have ta call new amiga vapor as well - just like
cheap crapple cube an' faster den 500mHz G4 dat jobs promise.

The current

sincrap try ta make issue out of dan's choice becuase he run outta
argument after dan beat crap outta him in debate - sincrap even threaten
dan ta shut up by claimin' he put tagether web site claimin' he some
sorta wacko cause he don' belive in treatin' women like doormat. dat how
sincrap work, he try ta play dodgeball when he lose debate by changin'
subject - just like dubya, who sincrap sound more an' more like evryday.
sincrap caught lyin' just like dubya lie 'bout drunk drivin' charge.
sincrap afraid of his own sex, dat he may like men, dat why sincrap brag
he big stud an' he make fun o' dan's choice, call him homo.
>

However, that's the only way you can manage to get a Mac
system with specmarks comparable to cheaper Athlon or
P3 based systems.

Anything can be parallelizable if you program it right.

This is rather the whole point behind BeOS.

If the bottleneck in your system is the end user, you
might as well just use an Atari ST and save your pennies.

No, you are trying to gloss over the fact that there is indeed
a macintosh at the Apple online store that has a price tag of
$7500.

>
>>>worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB

>Don't try to troll me into an advocacy fight. I don't care what you want
>to think about the value per dollar of Apple systems. You were simply
>wrong about the absolute dollar amount, by quite a bit.

No I wasn't. The prices I quoted were directly from apple.com.

However, there is a considerable ease of use issue involved with
macs. If you decide to castrate the system and then install your
own aftermarket parts, you are NEGATING the primary selling point
of a Macintosh.

It would be less absurd if you could actually get CompUSA to do
all the dirty work for you in this sort of situation (like you
could do for a WinTel PC). However, you cannot.

Then there's the whole issue of $5000 being a poor benchmark in
an 20000 AD where brand name PC's have also come down price. Apple
may have finally managed to move no but the rest of the world
wasn't stood still either.

"you're english" is "you are english". It should be "your english". And it's
"than you" not "then you". You learn to spell you little c*nt!

I don't think so....I would swear that the Amigas sold today are brand
spanking new in the box...Did you know that 060 and PPC cards can be added
to the Amigas?

Sounds like retail oversaturation. These chains do not carry much
selection in computer hardware and are usually last to get the
latest...Very good selection on office supplies which they concentrate
on..

> >

at over $1000 a pop! much less den milan '060 card. no one wanna buy
old amiga - dusty or not - ta throw more money down toilet.
>
> > > I made no such claim...

heheheh - sincrap deny many thing. sincrap deny dat he said jobs
destroy crapple if he come back. den he try ta wiggle out when dan come
back with proof sincrap did. we know when sincrap put foot in mouth, he
deny everyt'ing.

sincrap make ton o' mistake - him claim ati card crap, den is
reminded dat what in new mac. sincrap claim g4 cubes have been out fer
over a year. many people here caught yer mistake 'bout claimin' adobe
had midi app.

yeah i did - ya claim milan cost $2000, I refute dat. perfectly
normal.

Eh butthead...

no, me beavis. sincrap always be butt-head...

A brand spanking new DV
> with software bundle is a whopping $999 plus tax...

an' no one buyin' despite sincrap braggin'.

> > > Do they matter?

heheheh - obviously sincrap once again shootin' off mouth witout
checkin' out facts. me go ta business depot, dey have latest in HP,
e-machine, ibm - canon, epson. plenty a' peripheral. even sell visor
(razor next purchase). jus' don' sell imac or imac software...
>
> > >

not old used one - sincrap jus' take cursory look. also sincrap
should try mac-pro.com, dey still have new g3 b&w in stock.
>
> > > Have you been on fool.com?
> >

dey said fer any crapple-relate company. me talk with real crapple
power rep recently, said ya fulla crap. ya can reveals who employs ya.
also said dat if yer employer new what yer doin' here, he turf yas as he
no want law suit.

> >
> > sincrap chickenshit. big fat liar chickenshit.
>
> Lose arguments and get personal...What a Dubya tactic....

somethin' sincrap no well. dat why he call da salad a faker when he
show sincrap no nothin' bout video markett. dat why he call dan a homo
an' a schizo when dan reveal how little sincrap no. sincrap not only big
fat liar chickenshit, he also hypo crit. him little man who try ta act
like bully in sand box. 'cept 'tari users are one kickin' sand in face.
>
> sincrap!
> somewere in mn-a gore state

an' gore is about ta get gored...an' havin' such a big idiot like
sincrap as a supporter ain;t gonna help....

At least people can get what i'm on about, unlike that razor moron, with his
"l33t" typing, it might look cute in his world, but it's downright idiotic
in the real world.

English isn't my native language neighter, but at least i *try* to write it
correctly.

BTW, i make the above error quite often, so shoot me

> In other words, a vote for Bush is a vote for Microsoft.

Of course I don't know US politics but what does concern me is that Bush is so pro war. I mean this defensive grid aka star wars 2? It's not going to make things safer for Americans. It's going back fire in a big way.

Oh, nobody believes we (any anti-US country) are a threat anymore, if we just triple our long range missiles some should get through. The threat is back and that's what makes them happy. But cold war 2 is not the way.

Look at North-Korea; officially they're still at war but as communism clearly is failing and millions died of hunger, they are willing to reach out. Why not hang that rice pack in front of their nose and let them linger for more capitalism. That's the way. Not rebuilding defense and offense until something blows.

We've got the beginnings of agreements here, lets build on that.
Not on a cold war 2,
not on Bush.

This NMD crap will come either way, there's not much of a difference
between the two <censored> in this respect. Not that I could think of
much where there was. Nader would make one, but probably not for long
either...
Just to give you something else as a "strawman", and not to be 100% OT
here: yes, Bush means Billyboy, Billyboy sucks, therefore so does
Bush.

SCNR!

Of course the real reason Bush == bad is because he's a liar, a drunk and a
cokehead..... Not to mention the fact that he has a level of intelligence
akin to that of a dead stick insect.

Look, I'm trying to keep my mouth shut here, as I really don't like any of the candidates this year. But insofar as being a recovering alcoholic and drug addict (actually this is the first I've heard of coke, is this thread), does anyone remember Marion Barry <sp?>? The crack addict apparently is able to do a decent enough job while straight to get another chance. Also, look at the ENTIRE Kennedy clan....alcoholics, womanizers, and we worship them....

Damn I hate double standards....

Bush loves Microsoft, he even said he wouldn't tolerate something like an
antitrust case against them (not that he can do alot about anyway).

BTW, i read in the newspaper today that in a school in Maryland students
have to pay 20$ for computer usage, for M$ products, even if they DO NOT use
them! Hilarious! I can't believe those sods get away with that.... truly the
States are "silly" :)

(look at www.diamondbackonline.com for more info)

So basically you're saying that Bush didn't start the Gulf War, but
ended it, and that it was Roosevelt who got the US involved in World
War 2, and not the Japanese attack on the US.
Well, I guess that's one way of twisting history. OTOH, if we look
closer at what you're saying, we see that it can also be phrased
as: "every major US conflict this century ended under a democratic
president, yet only one ended under a republican president". Sounds
very different, doesn't it?

Well I don't find that particularly surprising, but then again I'm not familiar with how the US University (or normal school, for that matter) system works.

Here in .au you pay a semesterly fee to the university (varying from uni to uni, and calculated based on how much work you do each semester). That fee pays for the various services provided by the uni - legal aid, medical aid, child minding, computer services etc. You don't have any choice in paying this fee and a proportion of students probably never use the services it pays for (I know I very rarely have, in my 4 years at uni).

So, the idea of every student paying $20 so the vast majority of students get software free or for an enormously reduced price, does not strike me as particularly strange or bad. Heck, the vast majority probably think it's a _great_ idea.

Where's the problem here ?

You are arguing from ignorance. It is absolutely not the case that any
algorithm can be threaded so that it can execute in parallel on multiple
CPUs. In addition, many algorithms fail to scale perfectly even if they
can be threaded, due to synchronization points.

Be's marketing weenies probably did want people to believe the opposite,
for obvious reasons.

Render unto me a fucking break. That's a $7500 *system* composed of a
$4000 monitor and a $3500 Macintosh. 22 inch LCD monitors happen to be
quite expensive.

If you were smart, you would have quoted me the maximum price possible by
custom configuring a system -- that way you'd easily be over $5K on just a
computer. As I think I may have mentioned before, Apple overcharges
horribly for RAM, HDs, and so forth through their online store.

To reiterate, the point was that Apple's machines don't cost $5K any
more. Obviously, you can load them up with extra stuff and make them cost
that much, just as you can easily spend $5K+ on a single PC at <pick your
favorite major name brand cloner>'s website. But you wanted to argue that
Apple's computers cost $5K or more by default, as they used to in the bad

old days:

==========

1Ghz Macs will set you back similarly these days actually.
==========

Care to admit that you were wrong yet? The standard configuration of
Apple's high end Mac (not a system, just the Mac, keyboard, and mouse)
retails for $3500. This is considerably lower than Apple's prices for
comparable Macs in the past, which did often retail for $5K or more. I
seem to recall that the Mac IIfx and Quadra 950 debuted with prices closer
to $10K.

You never quoted a single price in this thread until the $7500 one just
now. You simply strongly implied that Jared Falvo's post about the price
of modern Macs relative to past Macs was incorrect.

You were wrong.

I'll guess Viet Nam and Richard Nixon. Do I win? ;-)

Hmm. The one war we lost was lost under a Republican administration.
The century's two greatest military triumphs-- the victories in the two
World Wars-- were acheived under Democratic administrations.

Personally, I think it's coincidence, but if this is the way you want
to compare the two major parties, go right ahead...

You would have gotten involved sooner or later anyway, imagine what would
have happened if the States didn't get involved, Germany would most likely
have taken over Europe, and what makes you think they would have stopped
there?

I would even replace "particularly" by "only". You got involved in WW2
because the Japanese attacked you, thus declaring war.

As did those that started under Democrats (WW 1 and 2, as stated above).

once again, it's time for the famous Toronto Atari Federation Flea market!

yes, on Thursday, November 16th from 7-10 PM, come in and see what there is to offer in all things Atari! Looking for hardware, software, or a rare item? Chances are you'll find it here! Need to sell something? You can do the same here as well, we supply the tables! Sell your old stuff, find yourself a treasure! And do so while rubbing elbows and talking with fellow Atari users!

Ken Macdonald will be there to demonstrate and sell the latest in Mario Becroft's products for utilizing modern hardware on your classic Atari, from mouse and SVGA adaptors to the new multi-outlet MIDI device to the QWERTY-X keyboard/mouse adaptor. We hear he may even demo some software on his tricked-out Falcon.

Dan Dreibelbis will be there as well - he's got his photos back from his New York City vacation, and he'll be showing them off with some interesting commentary on what went down.

Please note: as always, TAF does not support piracy or selling stolen goods. Anyone attempting to sell stolen software and hardware at a TAF Flea Market will be dealt with within the full extent of the law!

So come in and be prepared to sell, buy and browse, and have a grand old time at the Flea Market! See you there!

The TAF meeting will be held in the Silver Room underneath the library in North York Centre at 5120 Yonge Street - parking facilities available within the Centre. Those who wish to take public transit can take the York/University/Spadina line to North York Centre Station.

More Info:

Ken Macdonald , president - anarkist@idirect.com
Dan Dreibelbis, VP - dreibel@idirect.com

However, these wars are all wars that most right-wingers consider
noble causes, though Pat Buchanan disagrees wbout WWII.

Let's see:

WWI: the US stayed out of that one until 1917, and it ended in 1918,
all this involvement being during Woodrow Wilson's Presidency.

WWII: the US only got into the war after the attack on Pearl Harbor
in 1941; the opponents of involvement before then were usually
Republicans. FDR and Harry Truman were Presidents during that war.

And given the hatred that many right-wingers have for FDR, one
wonders if they would have been Brooklyn-Boys-style Fifth Colunmists
back then.

Korean War: supposedly a noble cause.

Vietnam War: same here. And while it was being fought, the
Republicans thought that it did not go far enough. And Nixon ended it
by pulling off a version of the Aiken solution: declare success, then
pull out.

I think it's Mikhail Gorbachev who deserves the bulk of the credit,
by choosing to allow the USSR's Eastern European empire to go free, and
for trying to create what he considered good Communism at home. Reagan
does deserve credit for turning around and coming to trust Gorbachev,
however.

Nixon, however, kept the war going for 4 more years, including a
massive secret bombing of Cambodia.

... little big competition
... The Atari Three In One.
... dedication. skill. creativity.
... http://www.magicos.de/lbc.html

sponsored by: st-computer +++ Paskud +++ AtariFan +++ Therapy Seriouz Software +++ DurSoft +++ Patrick Eickhoff +++ Triple a Mag +++ Woller GmbH +++ Didier Mequignon +++ RGF Software +++ Application Systems Heidelberg +++ Mario Becroft +++ More to come!

1 .: introduction

Following the enormous success of last years MagiC Game Contest, MagiC Online and the place2be are proud to present their next generation competition, that will once again unite the existing community and breathe new life into the Atari platform.
This year the organizers are able to provide not just one contest, but three. Besides two coding contests, the "Little Big Competition" also features a special graphics contest in cooperation with the Atari Icon Library.

Dedication, Skill and Creativity. The Atari 3 In One.

2 .: big ports, little helpers and a new look

We have decided to split this years contest into three categories.

.. big ports

The aim of this contest is to create the best possible software port to the Atari platform. There is an abundant amount of quality software packages available, complete with sources, waiting to be ported to our platform. Why not take the challenge to create the best possible Atari version?

- see rules for the exact requirements of the port

.. little helpers

The aim of this contest is to create a (relatively) small and useful tool or
utility; a program which simplifies everyday use and/or increases overall productivity. Interested entrants may examine features from other platforms, deciding to merge the best features of these systems with the elegance of the Atari environment. More Creative participants may choose to implement their own innovations; innovations that will dramatically increase the ease of use and/or efficiency of certain tasks. Will you be the one who revolutionizes the Atari platform?

- see rules for the exact requirements of the tool/utility

.. a new look

Every user is not a skilled programmer; but every user is equally important
to the survival of our platform. This contest celebrates this fact by encouraging the use of artistic and aesthetic skill: to create a modern new look for the "Atari Desktop 2001". For a long time, the Atari desktop has been a eclectic mixture of Icon Sets, background pictures, and winframes which were mainly adapted from other platforms. Our aim is to create a new coherent and original looking desktop. So here's the plan:

- icon set
Originally, the Milan II had planned on introducing Glow Icons to the Atari
platform, but now it's up to us. The first part of the Atari Desktop 2001 competition is to create the best looking set of glow icons. If you are not familiar with this style, you are encouraged to view the sample images of some Amiga conversions on the compo-pages. (Courtesy of Joachim Fornallaz)

- background pictures
Create the best looking background picture for use in our favorite Atari desktops.

- winframes
N.AES 2 and MagiC 6 both introduced the possibility to change the appearance of the window elements by using winframes. So the aim is to create the best looking winframe.

- see rules for the new look contest for the exact requirements

Any individual who wants to take part can contribute to one of the subcontests mentioned above. You don't have to create an icon set, background picture(s) and winframe(s). At the end of the contest the Atari Community will separately vote for the best icon set, picture and winframe. After that we will compile a package out of the best contributions (and possibly fill in some Amiga glow icons, which otherwise might be missing) into the "Atari Desktop 2001" package. All icon sets will be added to the Atari Icon Library.

3 .: little big sponsors

Our contest wouldn't be possible without the kind help of our sponsors. Here is the place to say thank you and introduce:

st-computer (http://www.st-computer.net/)
st-computer is the largest Atari computer magazine in circulation. With a full-color layout, professional staff, and a generous spirit; st-computer is truly a winner.

Paskud - Grzegorz Pancher (http://www.rsi.pl/paskud/)
Grzegorz Pancher is a popular musician who has utilized the powerful elegance of the ST in a Studio-setup to produce some very popular polish CD's. He shares his passion for Atari computers with others by producing

and selling several products, (including an IDE interface for the ST and Falcon RAM cards) and servicing Atari computers. "Paskud" has generously sponsored (5) of his ST IDE interfaces (for HDD and CD-ROM).

AtariFan (http://atari-fan.idz.pl/)
AtariFan is the premiere Polish magazine that has already established a proud name for itself, even in its infancy. They are kindly sponsoring a free subscription of AtariFan for the year 2001 with a free CD.

Therapy Seriouz Software (http://www.therapy-seriouz.de/)
Therapy Seriouz Software are the developers of Smurf, the graphic manipulation program that blows away its counterparts in both functions and speed. They are kindly sponsoring one full copy of Smurf.

DurSoft (http://dursoft.atari-computer.de/)
DurSoft Developments has made it possible for all Atari computers to take advantage and utilize Digital Cameras. By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with one full copy of PhotoTip
By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with the one full copy of PhotoTip.

Patrick Eickhoff (http://funmedia.atari-computer.de/)
Patrick Eickhoff is the developer of the great multimedia tool FunMedia. It has been in development for some years now and proves that you do not have to stray away from the Atari platform to have access to innovative multimedia tools. Patrick is kindly sponsoring one full copy of FunMedia (on CD)

Triple A Mag (http://www.triple-a-mag.de/)
Triple A Mag, the once Atari-only magazine, has recently expanded its horizons and now covers the Amiga, Atari, and Acorn platforms. Their attention to detail and support is outstanding, and so are their contributions to this competition. Triple A is supporting us with 100 DM in prize money and 3 full subscriptions.

rgf Software (http://www.rgfsoft.com/)
Richard Gordon Faika is one of the most active Shareware authors for the Atari platform. Tools like Arthur or the outstanding editor Luna are in daily use by many Atarians. Richard sponsors two "Moon"-Packages which include Arthur 2000 (+ all libraries), the latest Luna version and the latest release of the Luna Text Compiler. Worth 174 DM!

woller systems (http://www.woller.com/)
woller systems is a well respected Atari dealer as well as the initiator of many new products for our platform. Some of their products are: N.AES, GEM-TV Milan, Milanblaster. Like last year woller is generously sponsoring 3 copies of N.AES.

Application Systems Heidelberg (http://www.application-systems.de/)
Information pending

Mario Becroft (http://gem.win.co.nz/mario/) Mario is the well known hardware (and software) developer that continues to release must-have products at affordable prices. Whether it's connecting a PC keyboard to your ST or adding some extra Midi ports, Mario has just what you need. Mario kindly supports us this year with one Atari and Amiga serial mouse interface.

Didier Mequignon (http://perso.wanadoo.fr/didierm/)
Didier is an extremely gifted programmer who constantly pushes our platform to the edge, as is evident with his many essential programs. AniPlayer, his main project, has introduced many users to the joys of multimedia movies and digital sound. Didier is showing his support with (3) registrations to Aniplayer.

We have not yet decided which prizes will be given to what contest. But we will keep you informed. If you would like to support us by sponsoring our contest then feel free to contact us!

4 .: registration and support

If you want to take part in one or more of the contests, then please register by filling out the form on the compo-pages. This is needed to decide whether to skip one of the contests or not. You have no obligations after registering, it is just for information purposes. It also helps to verify that no one works on the same port.

It is also possible to register for the contest as a team of people (to be able to finish bigger projects). Just enter the names of all team members separated by a comma into the registration form. Although you won't receive any help from us when it comes to deciding which team member gets what prize.;-)

Any individual can contribute with several productions to all three contests. It is possible to work for one or more teams and on one-man productions. Whatever, just be productive.;-)

If you register you also have the option to receive free newsletters from us, which keep you informed about the latest contest news (new sponsors etc.).

This year we are also able to offer a free translation service to all our contestants (kindly provided by TransAction and DDP). This way we can assure that the user interface (probably even the manual) of all contributions is available in all major languages.

If you need beta-testers (with a certain system configuration), feel free to contact us and we will see what we can do.

5 .: rules

.. contributions

big ports and little helpers
- All programs must state that they were "Produced for the "Little Big Competition" both in the readme's and Info Box!
- Programs may be shareware but may not be crippled in any way.

- Programs have to work under both MagiC and N.AES (2).
TOS support is optional.
- using extended MagiC objects is allowed as N.AES 2 supports them.
- Programs can make full use of system extensions which are freely
available. We even encourage you to make your contributions support
modern features like BubbleGEM, OLGA etc.
- Programs may make full use of NVDI 5's extended VDI calls
- Programs which need network/internet support of some kind may use every
TCP/IP stack available for the Atari (STiK/STinG or MiNT/MagiCNet
preferred).
- Porting a software may also include reprogramming a software (big ports)
- A port should either feature a GEM-interface or shell (exception:
e.g. games running in fullscreen mode - VDI output still required of
course). Contact us if you are unsure. (big ports)
- system requirements can be set freely (minimum processor, RAM,
resolution etc.). Note: People who can't use your software
won't be able to rate it. On the other hand people who see software
pushing their 060 to the limit might be very happy and give high rates
to your software.
- Adding hardware specific parts (e.g. direct screen access) is
only allowed as an optional feature to speed things up on original Atari
hardware.

new look
- the icon set needs at least 12 entries
- icon sets must offer 2, 16 and 256 colour versions of their icons
- 16 and 256 colour versions have to glow
- other animated features are optional
- NVDI 5 palette has to be used
- icons have to be your original artwork (no conversions from other
platforms!)

- background pictures can have any of the following standard sizes:
640*480, 800*608, 1024*768
(supporting several resolutions is welcomed)
- NVDI 5 palette has to be used for 16/256 colour pictures
- colour depth can range between 1-16 Bit
(supporting several colour depths is welcomed)
- pictures have to be your original artwork
(scanning is allowed)

- you have to create the winframe(s) for both MagiC and N.AES (2)
- see the example archive which contains a MagiC and N.AES winframe
- winframes must support all colour depths
- NVDI 5 palette has to be used
- winframes have to be your original artwork
(no conversions from other platforms!)
- Instead of making a standard MagiC winframe you can also make an
enhanced NatFrame winframe as NatFrame is free.

.. voting

An exact description and rules for the voting procedure will be included to the vote forms.

6 .: deadline

Deadline for all contributions is May 12th 2001. No contributions will be accepted after this date.

Contributions shouldn't be released before the deadline, otherwise we'll have to disqualify this entry.

Absolutely no contributions that are publicly released prior to the May 12th deadline will be accepted. This includes public "alpha" and "beta" releases. The aim of this competition is to spark the creation of /new/ software and "themes" for our platform, therefor, no existing programs, icons, winframes, or Background images may be updated and entered into this competition. Failure to comply with this rule will ultimately result in disqualification. Entries may not be released prior to the deadline to ensure equality and fairness to everyone involved. All entries will have the same timeframe to be tested and voted upon. Furthermore, until the official closing of the competition and judging, ALL programs/sets will ONLY be available in a single archive. Individual downloads will be made available after this time. All contributions will be available for download on May 13th from the compo-pages.

7 .: the team behind this years contest

This years contest has dramatically grown in size and we are glad that some loyal Atarians offered us their support and help. So here is the place to introduce:

Bengy Collins (http://magicos.de/)
Co-Organizer Bengy Collins runs one of the largest English portal sites, Magicos.de. Bengy also has a monthly column in the German ST-Computer magazine. Co-Organizer of last years MGC 99.

Jan Daldrup (http://place2be.de/)
Jan Daldrup runs the largest International portal site, place2be.de. Jan works for the German st-computer magazine. Co-Organizer of last years MGC 99.

Joakim Hï¿½gberg (http://gokmase.atari.org/)
Co-Organizer of the "...new look" subcontest, Joakim is the Father of the "Atari Icon Library" and continues to prove beneficial to the Atari community by his continued work on essential utilities. Him and Dan Ackerman are currently working on aICQ.

Rafal Kawecki (http://kawecki.atari.org/)
Rafal is the webmaster of a popular Polish news page and will represent our contest in Poland. He translated the contest pages, kindly provided us with sponsors and manages the contact with Polish authors.

st-computer - Thomas Raukamp (http://www.st-computer.net/)
Thomas Raukamp, current editor in chief of the largest paper based Atari magazine left, gives us the opportunity to constantly inform all readers of

st-computer about the contest. Thus we are able to reach a far bigger number of Atarians including those without Internet access. st-computer is also generously sponsoring the contest.

TransAction (http://transaction.free.fr/)
DDP (http://www.cix.co.uk/~derryck/index.htm)
TransAction and DDP are crews of people who support the Atari Community by providing high quality translations of recent software releases. This year they also kindly help all contestants of the coding competition by freely offering their translation service to them.

Joachim Fornallaz (http://omnis.ch/jf/)
Joachim Fornallaz, the respected author of essential utilities and Milan webmaster, has kindly volunteered to create a custom GEMSetup Installation routine. The custom GSU will ship with the final LBC archive and will allow for easy and uniform installation.

Take care,
Bengy

mark wrote in message <8351120326301236.NC-

>Is a Mac just a generic PC box because they went from Nubus to PCI?

Hmm. No. But that's not exactly fair. Imagine that Apple had done things differently, and that they ditched Nubus, the 68k, and the MacOS 1.x-9x codebase all at once. If they had, I would have trouble calling it yet another macintosh, instead, I'd be forced to think of it as the 3rd platform Apple had created.

That they did all those in phases, says to me that even the lowly Mac 128k is a macintosh, along with the g4 cube.

Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5 codebase all simultaneously... not even a single transition amiga model. What's more, OSX still has some backward compatibility to the MacOS classic stuff. AmigaDE... hell, I don't even know how to describe it without spewing that sickening hype and PR crap. They are more interested in their ill-concieved "let's redefine computing and OS's" bullshit, than they are in building a "new amiga". If Apple were to have built that hypothetical 3rd platform, it would still be a computer, albeit a new platform. Pseudamiga isn't even doing that... with their MAME of operating systems.

There are certainly 2 ways to look at this. One, Apple had plenty of uninterrupted time, in which to space things out, and do each single thing at a time. Amiga, however, has been pretty turbulent, and if they are to "survive" it will be necessary to jump ahead, and do all of these things at once. This is what others will claim, and I'll save them the trouble by stating it for them... but it just isn't true.

Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip stacks, etc... are all integrated into win2000 or OSX. With amiga, if they exist at all (and I'm not talking just protocol stacks) they are 3rd party add-ons. This could be a problem. Then, you have a file system that can't come close to handling the 50+ gig hard drives that are now popular and cheap. 3d framework, ala openGL or direct3d? Not there. I can see that this will take alot of work. I am not blind. But rather than write the next version, they are ditching it!! If you have an incomplete project, that is 90% unfinished... that's alot of work, but do you abandon it, and start a new one, that by definition will have even more to do (90% vs. 100%) ??? Besides, the amiga gui shell is still pleasing, and capable. There are parts of the api that are worth keeping. And even if it isn't, then write us another OS! I would think it unwise, but I can see why some would want to do that. But they aren't. AmigaDE is an attempt to redefine the OS. They don't want to write a true OS, because getting into an OS war vs. Microsoft on the

low end, and UNIX on the high end, is a war that no one can possibly win. We don't need the OS "redefined" though, even if such a thing can help M$ in an anti-trust case (the browser is the OS, haha). And they don't need to fight this war. Cater to the amiga enthusiasts, and the people who like to try something different. And this does't even take into account the lack of a Zorro slot. What's the cost of this? $1 for the connector, $5 for the board space, and maybe a $2 pld?

I've came to the conclusion that it isn't that it's too costly or difficult to show some continuity, but rather that for whatever reason, they want none. Maybe they're embarrased by it, or the things that made Amiga "amiga" just don't fit their engineering philosphy. O maybe, they just needed a name, and were too lame to make one for themselves.

John

OK, I had promised myself I wouldn't continue in this thread. Steve, if you are reading, you were actually right, it shouldn't be here.

>"someone isn't screwing up the atari as bad as they are the amiga right
>now"
>
>How?

Yes, that is a fairly decent summary of my opinion.

>Is it simply the "we're spending $$$ to buy Amiga", six months later
>"we're losing millions, let's sell Amiga" cycle they're in? (Re: Atari
>to ?? to Commodore to Escom to ?? to Amiga Inc to ???)

I only became an Amiga enthusiast (pc only up until this point) right about as this started. I had thought that the gateway purchase would be the worst, certainly nothing could outdo gateway buying them so they could cannibalize patents, and if we're lucky release some i-opener like net appliance with the amiga brand.

Damn was I wrong.

No, the worst part is the current owners, and that it looks like they may just release an Amiga-branded machine/software. However, the brand will be the only thing left of the amiga.
Their OS will be ditched, and you should hear some of the lame arguments that I do, in defense of this move. "Oh, it would take so much to update it, that there is no way to keep it! It's 15 years out of date!". This from the same people that 3 breaths ago were claiming that Amiga all but invented the GUI and invented all of the features that windows95 later stole (which to a less exaggerated extent, I believe).
Their hardware platform will be completely ditched. This is more justifiable. The 68k is end of life, of course. They'll farm it out to a 3rd party (this may be the one wise thing that they do). There can be no arguments with these statements, from me or the more rabid "anti-Pseudamiga" crowd. However, there is more to the new hardware than just this. I personally feel that the new hardware lacks several necessary criteria for it to qualify as next generation amiga hardware. Further, the new hardware will be incapable of running AmigaOS 3.5. Backward compatibility shouldn't be absolute, but in this case its warranted to show continuity. Certainly the new "OS" won't run on the old hardware. Also, while the new hardware can hardly ignore PCI, there is not a single legacy Zorro slot, even though many amiga enthusiasts have paid dearly of amiga expansion cards. And don't get

me wrong, it's not entirely a practical want, either. It would show that this isn't some generic pc box running a funky os, but rather a new model in an older family of computer. Finally, the hardware is just an afterthought, as they intend to be a software-only company, and they are catering more to other platforms than their own! As far as that goes, my understanding is that with the "virtualized OS", that it won't even truely run native on their own hardware.
Amiga users don't care that the same apps can easily be run on a mac or pc, and mac and pc owners will certainly care less (the Borg cube cruises merrily along, folks). They are catering to people who laugh at alternatives because of feigned sophistication, and ignorance that you could actually prefer something else. Why? They want marketshare, which leads to quick easy riches in our economy today. Rather than rely on technical excellence, and a superior platform, which could make inroads in some niche markets, they are taking the coward's and con artist's way out. And they are whoring the amiga name to do it.

Think of it like this. Grandpa dies. Everyone is sad that he is dead. Some sheister offers to ressurect grandpa, wouldn't that be a wonderous miracle! Instead, grandpa is a zombie, going around eating the grandchildren. Maybe it's not so great he is back, if it's like this. This doesn't mean you wouldn't want him back, if it could be a true ressurection though. This a good metaphor for the amiga situation.

The atari, despite all the minor embarrasments that every platform suffers, has been spared this indignity. Consider yourself lucky.

Good heavens spare us all :)

> Damn was I wrong.

Yes, the future might even be bright this time

> No, the worst part is the current owners, and that it looks like they

Humm... i completely disagree there, sofar they've done as they said, we saw
OS3.5, soon OS3.9, the AmigaONE specs & soon the AmigaONE upgrade for
current Amiga's...
Seems they're doing fine

> may just release an Amiga-branded machine/software. However, the brand
will
> be the only thing left of the amiga.

I think it's to soon to make such conclusions, if the OS behaves in a simular fashion, and has backwards compatibility, i'm happy

> Their OS will be ditched, and you should hear some of the lame arguments

Me too would love to see the current OS survive, but i'm not going to shoot down the "new" OS until i've used it, just look at Windows9x & NT, they both act & look the same, but what's under the hood is quite different

> that I do, in defense of this move. "Oh, it would take so much to update

15 years? Hello? The only things lacking is Memory protection & VMM

> the same people that 3 breaths ago were claiming that Amiga all but invented
> the GUI and invented all of the features that windows95 later stole (which
> to a less exaggerated extent, I believe).

M$ has been steling stuff all the time (GeoWorks anyone?)

> Their hardware platform will be completely ditched. This is more
> justifiable. The 68k is end of life, of course. They'll farm it out to a 3rd

Not only is the 68K obsolete, the whole chipsets are

> party (this may be the one wise thing that they do). There can be no

Why is that? What would you call Next-Gen Amiga? Z-5? :)

> will be incapable of running AmigaOS 3.5. Backward compatibility shouldn't

This is still an unkown fact, and the current AmigaONE upgrade for the A1200 & A4K provide backwards compability, what we do NOT know is how performant it'll be

> be absolute, but in this case its warranted to show continuity. Certainly
> the new "OS" won't run on the old hardware. Also, while the new hardware can

See above

> hardly ignore PCI, there is not a single legacy Zorro slot, even though many

Zorro slots are obsolete, you don't find ISA slots in new PC's anymore neighter, and god forbit it if you want VLB

> amiga enthusiasts have paid dearly of amiga expansion cards. And don't get

The OS itself runs natively (the HAL layer) but the apps don't, although
they can be made to run native (eg for games, these can use CPU specific
tricks like Altivec or MMX)

> Amiga users don't care that the same apps can easily be run on a mac

Hell no, Amiga Inc has shown more bravery then M$ ever had, they want to
move the platform forward, and they might actually pull it of

> Think of it like this. Grandpa dies. Everyone is sad that he is dead. Some

But the amiga ain't dead yet, you could look at the Amiga as a cancer
patient, with tumors running amoc in herbody, while he fights for her life,
refusing to give into death

> The atari, despite all the minor embarrasments that every platform
suffers,
> has been spared this indignity. Consider yourself lucky.

The indignity of a possible survival? Sure

Amon_Re

Hmm.. Take a close look at MacOS prior to 8.x, does the name carbon sounds
familiar? They've been preparing their move towards BSD since 8.x

> That they did all those in phases, says to me that even the lowly Mac 128k
> is a macintosh, along with the g4 cube.

Amiga Inc, unfortunatly, doesn't have this luxury, a very small (shrinking)
market isn't viable for a bussinness

> Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5
> codebase all simultaneously... not even a single transition amiga model.

AmigaONE upgrades for A1200 & A4K, AmigaOS3.9... sounds like they're doing
there best to me

> What's more, OSX still has some backward compatibility to the MacOS
classic

It is, you're just to blind to see it, Amiga Inc doesn't have 5 years to
move their OS to a new CPU, and to implement new API's that'll be used in
the new OS

> Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip

In comp.sys.atari.advocacy mark <mdwh2@nospam.cheerful.com> wrote:
: On Sun, 12 Nov 2000 03:52:03 GMT, "**** ****" wrote:

:> No, the worst part is the current owners, and that it looks like
:> they may just release an Amiga-branded machine/software. However,
:> the brand will be the only thing left of the amiga.
:> Their OS will be ditched, and you should hear some of the lame
:> arguments that I do, in defense of this move. "Oh, it would take so
:> much to update it,

: And Apple are ditching their OS to move to a new BSD-based OS. And
: somtime Microsoft may get round to finally ditching their Windows 9x OS
: in favour of NT/2k.

Oh, come on. Apple had insurmountible flaws in their OS. And Windows still
hass a lot of stupid legacy. The AmigaOS may have some faults (we always
say VM, MP), but there is not a single bond between the "new AmigaOS" and
AmigaOS 3.x. No more than there is one between AmigaOS and a Windows
machine running UAE.

:> Their hardware platform will be completely ditched. This is more
:> justifiable. The 68k is end of life, of course. They'll farm it out
:> to a 3rd party (this may be the one wise thing that they do). There
:> can be no arguments with these statements, from me or the more rabid
:> "anti-Pseudamiga" crowd. However, there is more to the new hardware
:> than just this. I personally feel that the new hardware lacks
:> several necessary criteria for it to qualify as next generation
:> amiga hardware. Further, the new hardware will be incapable of
:> running AmigaOS 3.5. Backward compatibility shouldn't be absolute,
:> but in this case its warranted to show continuity.

: I agree here.. though they have said that there will be some sort of
: compatibility. For me, some level of compatibility is what I'd
: distinguish something between being 'a new Amiga' and 'an new machine
: with some Amigalike features at best' (Win2K can still run DOS stuff,
: Mac OS X can run older apps under some sort of emulation).

I don' care much about the hardware. Certainly, I've some investments in
my A4000, but clinging to it when I could actually run it on mostly
superior hardware would just be utter stupidity. If AROS were finished,
and had sufficient software support, I'd dig up some machine to install it
onto in a flash.

:> Certainly the new
:> "OS" won't run on the old hardware.

: It will be able to. You'll need an upgrade - but then the same is true
: if you want to run the latest Windows or MacOS on old hardware.

We're missing the point that there is no new AmigaOS. It's a userspace
program, much like Windows 3.

:> Also, while the new hardware can
:> hardly ignore PCI, there is not a single legacy Zorro slot, even
:> though many amiga enthusiasts have paid dearly of amiga expansion
:> cards.

: I presume that far more Amigas were sold with no Zorro slots than those
: sold with.

True. And most Zorro cards won't have much to offer.

: The Amiga isn't alone; ISA is being phased out of PCs, Macs no longer
: have Nubus slots. Did the A1200 stop being an Amiga because it couldn't
: used Amiga (A500) hardware?

Some fanatics would claim so. =)

:> And don't get me wrong, it's not entirely a practical want,
:> either. It would show that this isn't some generic pc box running a
:> funky os, but rather a new model in an older family of computer.

: Is a Mac just a generic PC box because they went from Nubus to PCI?

No, because it has its own positively unique architecture.
PCI is not processor or architecture dependent.

:> Think of it like this. Grandpa dies. Everyone is sad that he is
:> dead. Some sheister offers to ressurect grandpa, wouldn't that be a
:> wonderous miracle! Instead, grandpa is a zombie, going around eating
:> the grandchildren. Maybe it's not so great he is back, if it's like
:> this. This doesn't mean you wouldn't want him back, if it could be a
:> true ressurection though. This a good metaphor for the amiga
:> situation.

: Except that if you prefer the "old Amiga", there's nothing stopping you
: using a 68k AGA machine - they haven't died in the same sense Grandpa
: did.

Amen. Of course, I'd rather not use an AGA machine.

:> The atari, despite all the minor embarrasments that every platform
:> suffers, has been spared this indignity. Consider yourself lucky.

: All platforms that have advanced have also changed in many of the ways
: you describe. I wouldn't call staying with 68k forever (Atari or Amiga)
: being spared an indignity.

I'd rather not stay with 68k forever (move on WarpOS!), but the "new
AmigaOS" is no alternative. No more than MacOS.

: mark wrote in message <8351120326301236.NC-

:>Is a Mac just a generic PC box because they went from Nubus to PCI?

: Hmm. No. But that's not exactly fair. Imagine that Apple had done things
: differently, and that they ditched Nubus, the 68k, and the MacOS 1.x-9x
: codebase all at once. If they had, I would have trouble calling it yet
: another macintosh, instead, I'd be forced to think of it as the 3rd platform
: Apple had created.

Just like the Lisa.

: That they did all those in phases, says to me that even the lowly Mac 128k
: is a macintosh, along with the g4 cube.

After all, the G3 cube will run well-behaved 128k software, and it will
look like any other software.

: Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5
: codebase all simultaneously... not even a single transition amiga model.

There will be a transition Amiga model. And a big kludge at that.

: What's more, OSX still has some backward compatibility to the MacOS classic
: stuff. AmigaDE... hell, I don't even know how to describe it without spewing
: that sickening hype and PR crap. They are more interested in their
: ill-concieved "let's redefine computing and OS's" bullshit, than they are in
: building a "new amiga". If Apple were to have built that hypothetical 3rd
: platform, it would still be a computer, albeit a new platform. Pseudamiga
: isn't even doing that... with their MAME of operating systems.

Exactly. They say they wish to capture the "spirit" of the Amiga. I doubt
that it will be caught. Has anyone managed to do that as of yet? What is
this spirit, anyway?

: There are certainly 2 ways to look at this. One, Apple had plenty of
: uninterrupted time, in which to space things out, and do each single thing
: at a time. Amiga, however, has been pretty turbulent, and if they are to
: "survive" it will be necessary to jump ahead, and do all of these things at
: once. This is what others will claim, and I'll save them the trouble by
: stating it for them... but it just isn't true.

They could just look into WarpOS or AROS. Certainly, WarpOS is
PPC-centric, but PowerPC has never hurt somebody.

: Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip
: stacks, etc... are all integrated into win2000 or OSX. With amiga, if they
: exist at all (and I'm not talking just protocol stacks) they are 3rd party
: add-ons. This could be a problem. Then, you have a file system that can't
: come close to handling the 50+ gig hard drives that are now popular and
: cheap. 3d framework, ala openGL or direct3d? Not there. I can see that this
: will take alot of work. I am not blind. But rather than write the next
: version, they are ditching it!! If you have an incomplete project, that is
: 90% unfinished... that's alot of work, but do you abandon it, and start a
: new one, that by definition will have even more to do (90% vs. 100%) ???

Err, please try to look into things before you start spouting complete
rubbish, ****.
AmigaOS 3.5 has got a stack. 3.9 will have the very competent Genesis.
The filesystem has been updated since aeons ago to handle hard drives in
the terabyte class. I run a 20 GB one on mine, and I intend to get another
drive, too.
3D framework is there in the form of Warp3D, which AFAIK is an OpenGL
implementation.
90% vs 100% is not a lot, but I dare say that the AmigaOS is 90% complete,
as opposed to 90% incomplete.

: Besides, the amiga gui shell is still pleasing, and capable. There are parts
: of the api that are worth keeping. And even if it isn't, then write us
: another OS! I would think it unwise, but I can see why some would want to do
: that. But they aren't. AmigaDE is an attempt to redefine the OS. They don't
: want to write a true OS, because getting into an OS war vs. Microsoft on the
: low end, and UNIX on the high end, is a war that no one can possibly win. We
: don't need the OS "redefined" though, even if such a thing can help M$ in an
: anti-trust case (the browser is the OS, haha). And they don't need to fight
: this war. Cater to the amiga enthusiasts, and the people who like to try
: something different. And this does't even take into account the lack of a
: Zorro slot. What's the cost of this? $1 for the connector, $5 for the board
: space, and maybe a $2 pld?

There is no point in Zorro on a new architecture, and it certainly would
be more costly to add than just some "bucks".

: I've came to the conclusion that it isn't that it's too costly or difficult
: to show some continuity, but rather that for whatever reason, they want
: none. Maybe they're embarrased by it, or the things that made Amiga "amiga"
: just don't fit their engineering philosphy. O maybe, they just needed a
: name, and were too lame to make one for themselves.

Basically, what we ended up with when Gateway bought the Amiga was a
motely crew of disgruntled Silicon Valley engineers, each with their own
agenda to revolutionise the computer world. Then they were given a cute
little machine, whose name and user base they would take as a platform for
their new, revolutionary system. They've never been Amiga users before,
and have very littlke actual understanding for the actual Amiga spirit,
which they claim to further.

Very few things are really that strictly serial. Even those
sorts of things can be sub-divided. Infact, those of us with
an actual clue are aware that "divide and conquer" is the
first maxim of computer science.

TPC/C is a great example of this.

[deletia]

I am. That's why I realize that artificially deflating prices
by expecting Macintosh users to futz with their hardware
internals is quite absurd.

What makes you think the process will be constrained to only
inverting one matrix at a time? You both are thinking far too
crudely. Get out into the world every so often.

OK I know if I search for years in FAQ files I might find what I am looking for but perhaps one of you fine fellows can help me out quick. I have a quite a few Atari machines around. Mega4, ST, hell even some 400 and 800's. My question is what software is there out now that will allow me to use my ST or Mega4 to surf the web as easy as I can on my shitty PC with Netscape? I use my Mega4 for lots of crap and I hate my pc but that's what I'm on-line with now. Someone tell me what I need so I can kiss the PC goodbye. Then again, is there even anything out there that makes this dream possible. Please help. Oh and while I'm thinking of it, is there anything that can link my Palm 3x to my Mega4? I'll toss my pc in the can if this can happen.

Hi, JPK,

You're in the wrong NG for such a question. Try:

comp.sys.atari.st

or

comp.sys.atari.st.tech

The basic answer to your question is CAB1.5 as the browser and
STIK/STING/DIALER as the ISP interface, for the freeware route, but
limited as to speed and CAB2.8 and ICONNECT from ASH for the commercial
route. I use CAB2.8 with STING/DIALER on a Falcon and Milan and on the
former it's bearable, with images shut off and with the Milan as good as
a low end Pentium. With the MegaST4, I found accessing the Net JUST
about bearable re speed. You will also need to drive your serial ports
at at least 14,400 and will need HSModem for this.

But you will learn much more from the guys on the above NGs

Bob King.

The term "Democrat" in the 1950's is not the same as it is today... in 1950 the average Democrat is roughly
equivelant to todays moderate-republican. Both parties have shifted to the left an order of magnatude.

If you told a registered Democrat in 1950 that you were in favor of national health care and free condoms, he would
call you a communist, however, this is how Clinton was elected.

This thread is rediculous, who the hell votes for the president of the free world based on his
opinion of a PC operating system? Yikes!

Why is it so important to break MS up? So what if windows sucks, dont use it. Its NOT MS's fault that
every other competitor refuses to compete. Hell, I was rooting for Amiga, OS/2 and Mac, but each killed
themselves. Amiga was GREAT, but Commodore was a toy manufacturer, and MS had nothing to
do with why Amiga failed (in fact, MS *HELPED* Amiga, I started out by learning AmigaBasic, a MS
product). Mac, well, Mac is Mac, and OS/2, its almost like IBM *wanted* OS/2 to fail, and they continue to
try to drop support for OS/2 despite customers who BEG them to keep it alive.
I want to see an OS suceed because its BETTER, not because the government killed MS. MS can be beaten,
if a company makes at least a half-assed attempt. Adobe makes ALOT of software even MS is afraid to go
head-to-head with, then theres AOL, Linux ect...
Even BeOS isn't really competing with them, by choice. Their main product is BeIA, BeOS is a sideline, and
the free version requires windows. Every heading on Beos's site lists BeIA first, then "we also offer BeOS..."

Its the "in" thing to hate microsoft, but people go home to Windows PC's every day, when they can run anything
they want to. I like linux, and BeOS, but I use Windows 90% of the time, its what I use at work also, I'm a PC
technician. MS will probably continue to dominate the desktop market untill a developer actually markets an OS,
not just has one available.

Microsofts success is based on the fact they were there when the time was right.Hell, if I were Bill Gates, and
had his money, I'd say fuck this, no more windows. I'm retiring, and getting out of the OS business, but I wont sell
windows to anyone, I'll just let it die. Have fun guys!

I'm not pro-microsoft, I'm pro IwishsomeonewouldhavetheballstomarkettheirOS. If their were an AmigaOS that ran
on PC hardware, and supported hardware within 3 months of its release,and had a single user mode, I'd gladly
pay for it, I'd pay $500 for it. I don't really care if its $free or not, or if its GNU-free/open source...Just support it,
release it often (don't let it stagnate like OS/2), make available developer tools, make it your MAIN business, rather
than a sideline, and I'll run it as my main OS instead of just "playing" with it.

Cmon BeOS, give me the choice of Multi-user, commision Loki to port games, flood my ass with software and drivers,
and charge me $500. (and make www.beos.com lead to a BeOS page, not a BeIA page)

David Ogg a ï¿½crit :
> Why is it so important to break MS up? So what if windows sucks, dont use
> it. Its NOT MS's fault that
> every other competitor refuses to compete. Hell, I was rooting for Amiga...

Your're right, but MS have a market way...very hard !
can you buy any PC in any store whithout window ?
no one can, because you havn't any choice, you must buy your PC
with window, and that's all !

Too, it's very dangerous that the same compagny, sells,
OS, applications and development tools...You cannot choice
easily, because if you don't use VC++..you will have some
problems...in this way, spliting MS (no destroy them !), could be
simply more efficent for micro market. I use NT at work,
but i use Borland...and I can say, that it's not always
easy everydays, because MS doesn't permit you to use other
tools easily (.LIB problems, DirectX, etc...)

but it's just my opinion !

It is true that we (USAns) killed more USAns than the iraqi's did. Is this a bad thing? Before you go pointing your finger and saying how inefficient we were, look to the statistics in your own military. Of course they might not like to fess up to how many of their own they accidentally killed. Most militaries have difficulties explaining to their countrymen that it wasn't the enemy that killed their sons.

The politics behind the Gulf war are a little murky. I don't want to figure out the rational for it. A bunch of countries helped out on the "allied" side. I figure most of those governments wanted to be there.

For all the pride we seem to have in our country, most of us still trace our lineage to other countries. Whether it be Italian, French, German, English, Dutch, African, Mexican, Spanish,... we all seem to know our heritage. (My family tells me I am 1/4 German, 1/8 Scotch {since scots and english are very different}, the rest is a murky mix of the glowing melting pot that is the populace of the United States.)

Socialism does not preclude freedom. Freedom is a concept separate from political theory. There are many people deep inside Tyrranical dictatorships than the average Citizen of the United States. We in the US believe we are free, but fail to understand the responsibility that goes with Freedom.

By "free world" I mean the US, How come no one bitches when Austrailia
calles themselves "down under" or when
england calls themselves the "empire where the sun never sets" (or
something). We could call ourselves the "new world"
like back in the day, but we're not so new anymore. Aw hell, I never noticed
untill I got on usenet that foreigners
have such nationalistic penis envy.

Well, yes we are, but there are a lot of democratic principles in
use. Since the poster spelled it with a lower case 'd', I'd assume this
is what was referred to instead of the nation itself.

The two are mutually exclusive. Anarchy is the absence of government.
(*) Socialism requires a strong government which redistributes most of
the wealth of its citizens and controls key industries by threat of force.

Most governments, including that of the United States, are at least mildly
socialistic, primarily because those in positions of power love the fact
that it gives them greater power to exercise. There are no demonstrated
advantages of the system outside of this.

(*) One would expect that a true anarchy would also result in the
redistribution of wealth by force on a massive scale, but unlike socialism
it wouldn't be the government doing so.

"[s]o long as Socialism was understood in its wide, generic, and true
sense - as an effort to abolish the exploitation of Labour by Capital -
the Anarchists were marching hand-in-hands with the Socialists of that
time." [P.Kropotkin, "Modern Science and Anarchism"]
(from the Anarchist FAQ at
http://www.geocities.com/CapitolHill/1931/secA1.html#seca13)
That some authoritarian governments cho[o]se tho call themselves
"socialist" says little about the relation between anarchism and socialist
ideas.

regards
Matthias

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY Guarenteed

READING THIS MESSAGE WILL CHANGE UR LIFE FOREVER

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1)Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #2)Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #3)Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #4)David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #5)Kevin Kniceley
: 4029 Minard Rd. N.W.
: Dover, OH 44622

: #6)John Decowski
: 51 Walnut Hill Rd
: Derry, NH 03038

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,

: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

apple needs atari, and amiga ppc clones to overcome this, they cannot do
it by themselves they are losing the war, even if computers sales are
slowing for the pc, that does not mean they will buy a apple.
in a slow economy people are very shrewd with there money, and they do
not like to think that they will be stuck with something that does not
recieve support, so if you want lots of new innovative software, just
say atari/amiga to the rescue!
thanks,
lance

PC sales have slowed to a crawl this holiday according to all the press
accounts.. Customers are opting for digital devices this season and are
taking a break from computer purchasing...

Also, according to comments by SJobs, Apple screwed up by not having a CRW
device standard, confusion on who is the customer for the Cube etc. As a
result, they have put the breaks on production to slim down inventories
by Dec 30 in contrast to Compaq and HP who are continuing to stuff the
channel. Can you say blood bath beginning Jan 1 for those two?

Not having clones, what ever that is not a factor with the changing market
this time around.

Often you want the slution to one problem, not x problems.
And more often then not, you need the result of a previous calculation
to execute the next.
The world is not as simple as you may think.

I stated that voting based on a candidates OS preference was dumb.

I get flamed by foreigner with penis envy. why?
not because he was responding to my point, but he was
somehow offended that "free world" was used in reference to
the US.

Should I take offence to "empire where sun never sets" being
used in reference to England?
Should I be offended by the people from "the land of the rising sun?"
"land down under?"

We used to call it "New world","Land of the Free", or "free world"

I don't get how I'm suffering from penis envy or considered a foreigner
talking about an election in my own country that I voted in. I do,
however, feel someone's nose a little too close to my ass.

And quite a few even believe it was just that. That the meaning of "world"
is quite different from "country" should become clear even to you when
you think about the people from Monaco (look it up it the CIA world
[sic!] fact book) calling their country "the free world".

> I don't get how I'm suffering from penis envy or considered a foreigner

I don't think the USA had a penis to be envious of, although it has a
rather big asshole that a lot of "leaders" like to kiss. But be assured
that your own personal ass is not in danger at all, not from anybody's
nose here at least.

Matthias

Usually, the solution to a particular problem is infact
the solution to several problems. This is basic problem
solving, CIS 100.

>And more often then not, you need the result of a previous calculation
>to execute the next.

You're the one trying to portray the world as simple.

Meanwhile we have multicpu Quake3, multicpu OpenGL, multicpu
video decoders, shared nothing databases, shared nothing
renderfarms, loosely coupled Beowulf clusters doing all
sorts of interesting and mathemically interesting problems
and operating systems that have been designed since decades
before the Atari ST to maximize the potential of hardware by
doing many diverse things at once.

I can provide concrete examples of my point of view. The
opposing point of view can only come up with toy projects
you might find in an Rudimentary Algorithms text.

Those are trivial since they are separate task part of one process.

Rememeber you said :

"Anything can be parallelizable if you program it right"

And thats wrong.

>
> I can provide concrete examples of my point of view. The
> opposing point of view can only come up with toy projects

The point of view is 'Anything' can be done in parallel, and thats false.
Even at the instruction level, superscalar precessor dont alway acheive
full parallelism because of dependency.

The truth in this world is not everything can be parallelized because of
dependency.
If you cant grasp the concept of dependency, and think because quake
benefit from 2 process it prove your point. Lets end this here.

Stephan

You are quibbling with pedantics versus practical engineering.

[deletia]

The trivial example first cited was one in linear algebra.

The counterexamples I provided are pretty much nothing but matrices.

--

Also while the herd mentality is certainly there, I think the
nature of software interfaces and how they tend to interfere
with free choice is far more critical. It's not enough to merely
have the "biggest fraternity", you also need a way to trap people
in once they've made a bad initial decision.

5794. Amiga One Specs

Newsgroup: comp.sys.atari.advocacy
Date: 2000-12-18 03:03:39 UTC
From: sinclap@nospam.net
Message-ID: <sinclap-1712002104090001@user-33qtevm.dialup.mindspring.com>
Source record: 1259

Seems like the new Amiga will use a modern processor and sub systems
unlike a certain cretin which went no were...

October 21, 2000, Melbourne, Australia - It is with great pleasure that we
are able to announce the
first new Amiga hardware in over 6 years. The AmigaOne, our first
consumer product, will be
targeted at the desktop and workstation market. Further products to
follow will cover the markets
from Personal Digital Assistants and upwards. All these products will run
a single piece of software,
the revolutionary Amiga Digital Environment (DE).

We completed the AmigaOne specification three months ago, and dubbed it
the "Zico". It is a
specification and not a product because Amiga is a software company, not
a hardware
manufacturer. The ability of the Amiga DE to host itself on multiple
hardware and operating
system platforms frees us from hardware dependency and gives our partners
and our customers
the freedom to chose the hardware that best suits their needs and tastes.

The Zico specification is as follows:

One AmigaDE friendly host processor (PPC, x86, Arm, SH4, MIPS)
64MB+ memory
Next Generation Matrox graphics card
Creative EMU10K1 based audio card
10 GB+ HD
CD/DVD
USB 1.0
Firewire
10/100 Mbps Ethernet
56k modem
Spare PCI slots for expandibility

With the completion of the specification
stage of the Amiga One, we contacted
several respected hardware companies
with a view to selecting partners who
would be interested in creating AmigaOne
products.

The AmigaOne process involves close co-operation between Amiga and our partners' hardware groups, the running of the AmigaDE on the hardware, and a thorough quality certification of the final product. Only then can the product be called an AmigaOne.

Whilst still in detailed negotiation with several companies, we are delighted to announce the first partner company and its initial set of AmigaOne products.

The Eyetech Group Ltd, of Stokesley, U.K. already has an excellent reputation in the Amiga community. They have done much to keep the classic Amiga alive during the last five years, and we feel that in the creation of the first new Amiga machines and the transitioning >from the classic to the next wave, that experience will prove invaluable.

Bill McEwen President of Amiga Inc commented: "This arrangement builds on and extends our existing partnership agreement with Eyetech, first announced in April of this year. Our experience during this period has shown Eyetech to be a no-nonsense company capable of delivering what they promise on time and this consideration also weighed heavily in our choice of a hardware partner for the PPC based AmigaOne."

Alan Redhouse, Managing Director of UK-based Eyetech, said; "I am delighted that we have been able to build on our existing partnership with Amiga and continue our close working relationship with them on both a technical and manufacturing level. Our decade of Amiga experience, plus our hardware and software efforts to push the Amiga forwards means that we are able to work with Amiga to deliver a proven upgrade solution to Amiga users which gives their existing 'Classic' applications an immediate and substantial performance boost whilst providing full forward compatibility with the new Amiga DE. Our work on the Predator line of boards means that we can help Amiga to fulfill its requirement of maximising the investment of the current community as it moves forwards."

Fleecy Moss, Chief Technology Officer, Amiga Inc added: "After talks with the hardware development staff of several companies I am convinced that working with

Eyetech will allow us to
offer an elegant solution that gives both an excellent level of backward compatibility and a
powerful basis for the new Amiga Digital Environment. Top of our requirements list was to ensure
that those Amigans who have spent considerable money in staying with the Amiga would not be
left out in the cold. Whilst you can't please all of the people all of the time, we think we have come
up with a set of products and solutions that will put a smile on as many faces as possible."

Eyetech is focusing on an immediate need in the existing Amiga market. Many have already
invested considerable resources in their classic Amigas, both in terms of hardware and in terms of
software. Whilst keen to move forwards with the AmigaOne, they also want to maximise their
investment in the classic platform.

The Eyetech AmigaOne PPC 1200 is a custom board which uses Eyetech Predator technology
with the "zico" specification to provide a perfect synergy of classic and next generation. It
provides all the functionality of the standalone AmigaOne PPC, but has been extended to mate
with a classic Amiga A1200. This allows customers who have a serious investment in the classic
Amiga to continue to use their machines whilst also having a brand new Amiga at their disposal.
The 68k processor in the A1200 will be emulated at a substantially increased level via the PPC
processor on the AmigaOne, whilst the classic operating system can take advantage of the
AmigaOne's next generation hardware resources.

The AmigaOne PPC 4000 machine is similarly designed to allow customers who have a significant
investment in their classic Amiga A4000 to be able to move that investment forwards whilst also
benefiting from the next generation capabilities of the AmigaOne.

The Eyetech AmigaOne PPC 1200 will be available as an upgrade for owners of towered A1200
computers, the Eyetech AmigaOne PPC 4000 as an upgrade for Amiga 4000 desktop computers in
tower conversion cases. Options for producing AmigaOne PPC upgrade designs for other Classic
Amiga designs (such as the A3000 and Amiga International A4000T) will be looked at (subject to
demand) once the A1200 and A4000 products are released.

In order to implement all the features of the AmigaOne specification the, A1200 and A4000
upgrade versions will feature one AGP and six PCI slots, a user-upgradable G3/G4
(Macintosh-type) cpu slot, up to 512MB SDRAM and a high speed IDE/ATAPI interface. The
system will be dual-bootable both into the Amiga DE and into Classic Amiga Workbench. This
latter feature will allow purchasers to have the performance benefits of full G3/G4 cpu speeds and
512MB of SDRAM memory whilst running Classic Amiga software. Both these boards are
scheduled to ship in 1Q01, with developer versions being available in December 2000.

Design of both the Eyetech AmigaOne PPC A1200 and A4000 products has been done with great
sensitivity to the existing user and developer community.

"By releasing the classic compatible AmigaOne PPC products first," said Alan Redhouse. "We are
providing a transitional path forwards for the existing community, enabling them to maximise their
current investment whilst also leaping ahead with the new Amiga DE."

In order to facilitate this transition, the classic Amiga operating system will see its lifeline extended.
OS3.9, to be launched before Christmas will add a raft of new features and functionality, and will
be able to run on the Eyetech AmigaOne PPC classic products.

Eyetech are also keen to talk to existing hardware manufacturers about possibilities for licencing,
manufacturer and other co-operation in order to ensure a smooth transition of the existing Amiga
community from the present to the future.

Amiga is also very close to signing up partners for a standalone AmigaOne machine. The ATX
form factor AmigaOne has been designed to run the full consumer version of the Amiga Digital
Environment (DE) allowing the best of the Classic Amiga software which has been ported to run
directly under the Amiga DE, and the use of a wide range of Amiga DE-based digital content -
such as productivity software, content creation suites, development environments and 3-D games
- to be used 'out of the box'.

All this work - including extensive testing of hardware and software components - is scheduled to
be complete in time for end user deliveries 3Q01. Amiga Inc is currently in negotiation with several

potential partner companies for the development and manufacture of the stand-alone AmigaOne
and its related digital content/software. Companies interested in producing this version, utilising
the PPC processor family include Eyetech, and bplan GmbH of Germany. We hope to have
announcements to make on this within the next few weeks. Other companies and other
processors are also under negotiation.

A new website is being set up, specifically to provide a focal point for news, questions, comment
and discussion on the AmigaOne, and we encourage people to visit it and participate.

Umm I could explain to you that multithreading is not parallel computing,
and that the best example of parallel computing on Intel processors is
MMX SIMD instructions, and for the PowerPC it's Altivec. Neither Intel or
Motorola are responsible for these things, the ideas behind SIMD have
existed since the 1960s. If you look at Fortran, you will notice a few
things that suggest how long this stuff has been around, like vector
restriction.

This stuff is known as vector computing, which is what super parallel computing
is all about. Now surely you're right if you say that correcting a set of
pixels for perspective correct texture mapping is highly parallelizable..
But Quake doesn't work just by transforming some pixels..
The matrix inversion thing is a valid dismissal of your statement that
"anything is parallelizable if you program it right"
In a program that has to do matrix inversion at least once, there is one
"thing" that is not going to be parrallelized!

Now, to prove me wrong, parallelize this:
An in-order walk of an arbitrary binary tree! :-)
This is a good example, because this is a major part of the Quake
graphics pipeline, the walk of the BSP

If you don't have an answer, then I suggest you go home.

Oh yes.. when you break a process into threads, you're not
parallelizing, as the OS/system is responsible for when/how your threads are
called. Consider this a deterministic multithreaded app has to give the
same result running on one processor as two, so clearly its not
parallelization. In a parallel algorithm, the actual data or instructions
are deterministically processed at the same time, as a part of the
algorithm.. this is not the case with multithreading!

Multithreading/tasking has nothing to do with algorithmic parallelization!

Not sure about others, but I'm still digesting the excesses of the holiday period (groan!). That takes a LOT of siestas, sleep and sunbathing, which leaves little time for reading/sending news items...

Still, sinplop is either dead or on holiday (janitors DO get holidays I believe!)...so there are no posts worth debating right now...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. Just 1 thing, the Coldfire ATARI project! That SHOULD be worth a little bit of advocacy angst should it not?

My own opinion is that it will DIE! Those Medusa guys are trying to blackmail us into buying with their "...500 pre-orders or no go..." philosophy...do they actually have a machine to sell?

Hmmm - we had a bit of white Christmas (about 5cm of the fluffy stuff)
while yesterday they had a 50cm dump in Nova Scotia & New Brunswick -
but 40C --- nawww that's too hot for any human to actually enjoy !

Me ..... between -15 and +25C is tolerable - beyond that - excessive !

The Canadian Curmudgeon (in sunny, getting dusty, 0C, Calgary)
Canada - where ignorance prevails, tyranny persists

Nope, I'm skint at the mo' so I had to stay here in Christchurch for Xmas
and New Years. Queenstown is neat, but its a mad-house at New Years, as the
population triples on the 31st of December...

We had horrid rain and bitter cold wind on New Years so your folks probably
did get white flurries being at that altitude. There was snow in Dunedin at
sea-level a month back. I was there competing in a track&field meet. You
normally wear a skimpy singlet and shorts, but I ran out of gear to compete
in, short of piss-drinking clothes!

I've heard its kinda dry around Melbourne currently...fire risk stuff...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

You lucky devil...we had +7-8C, driving rain, and big wind chill here in Christchurch on New Years eve. Both Xmas eve and New Years eve were preceded by wicked electrical storms, hail, rain, etc...we'd also like to see the first sunrise of 2001 soon...its been cloudy for most of 'em!

40C would be a bit hot tho', funny how you can never reach that happy medium in life isn't it?!

Yeah, clockmeister's 37 is nothing 39 here today and a TOTAL fire ban. I hate summer. Long for the frost and rain. Besides my study get's too hot (only bloody room in the house that isn't insulated besides the dunny). Can't go hunting because every thing is sitting in the shade, there is fishing I suppose.....

Mark

PS does MIDI on the Atari suck.

We've had a total fire ban for months... and 39C doesn't bother me at all,
it's the extreme humidity that kicks you in the guts.

Long for the frost and rain. Besides my study get's too hot

Oh, well we can't all be Vegans;-) The wheather dude's reported 43 for Melb
yesterday, but luckily we only got to 37. But as you say the humidity
sucked.

Is anybody going to advocate anything today?

Mark

I think it is time we all took affirmative action. I vote we sit down and have a discussion to resolve to advocate something immediately. Possibly with beer and pizza......

just for the record I spent most of my life living in the country. I hunt
vermin and food. Both I enjoy the same as fishing, and growing your own
food. Incedently I have found that most country people don't kill randomly,
but bored city folk do. I grew up hunting and fishing and do enjoy it. It is
the most relaxing thing I know of. I do get a little emotional about it, I
have been doing it since I was about 7 years old. Which is the best way to
learn respect for the enviroment. Incedently my Dad was in the New Zealand
```

wildlife service, I spent most of my time living on trout hatceries. Hunting and fishing is a way of life for me, not an ethical issue.

Post # of 74714

Larry, Inventory
is actually pretty good and was pretty good on Dec. 31st. At the wholesale level, it was less than 4 weeks including the two problem children of
the Powerbook 400 and the Cube. And today, just those two units are the only big problems in the lineup. Virtually everything else is below 3
weeks of wholesale inventory.

All of the iMacs have been restocked since the beginning of the year. And using the sales rates since Jan 1, there still are less than 3 weeks in
stock. This is very good.

The comparative problem now is that the wholesaler has been out of stock for so long, that the sell through rates are currently very low. So
calculating "weeks supply" is both overstated and suspect. Once all units are back in stock, then the calculations will be much more reliable.
With the change in the product lineup, and lack of immediate stock to sell, the sales will be shakey for a while. The question will be what happens once everything is back in stock.

sinclap!

Yeah, but the Beef roast's don't deliberately roll over carve themselve's up
and then shrink wrap. What's the diff? Just some people don't like working
for their food. Most animal's would hunt you given half a chance, after all
you are only human:-)

hi i'm looking for the rom image of the lynx to be able to play it on the
(mac) emulator but i'm not able to find it anywhere on the web. can anyone
help me out?
if you have it you can send it to me by email (mrtnglas@dds.nl).
i also own a lynx handheld so legally it should be alright....

well tanhx anyway.

Ok, granted - that might be the case in NZ where as far as I can tell the environment is something of a issue that is taken fairly seriously. In West OZ, there is a saying that the farmers have a mentality of "if it's alive, kill it". That, in my experience with the farmers that I know seems to be pretty accurate unfortunately.

My brother in laws girlfriend's family take great pleasure in sharing their "hunting" mishaps - which consists of things like rabbits and kangaroos having various parts shot off and other acts of cruelty (like the ones that get away in such a state because they can't bring themselves to actually kill the animal after they've injured it). I don't see the humour in that sort of thing, in fact it pisses me off - a lot.

Catching more fish then people intend to eat, only to throw away the excess is also something that pisses me off. I see that all the time, such a waste.

I could go on and on, but I think you get my point.

I grew up hunting and fishing and do enjoy it. It is
>the most relaxing thing I know of. I do get a little emotional about it, I

Hunting
>and fishing is a way of life for me, not an ethical issue.

It sounds like you are a responsible type, not the kind I'm used to unfortunately.
We're obviously seeing things in different perspectives and under different circumstances, but I understand and respect your point of view.

Never judge a book by it's cover, and never underestimate people. And most
of all never associate Conservation with preservation. Australia's wildlife

need's looking after too. I think you will find it in more danger than NZ's. Australia has the highest rate of urbanisation in the World. More than 80% of the population live in major eastern seaboard city's. And to top it off, I still cant find anyone in Australia with a nice cheap Jaguar to sell. I think we can safely say that, yes we do have a very different perspective's, and that I understand how you feel. But don't assume that a hunter (or fisherman) is not a conservationist. After all if there are no deer or bunnies left, there is nothing to hunt :-(. Nuff Said.

Regards

Mark

That's preservation, as opposed to conservation, which is pretty much on the ball tho. We are after all a nasty species. As far as I can see the best way to go is to try and sustain or improve the wildlife so my children will be given the opportunity to do and see what I have been fortunate to see. Unfortunately greenies (yes a generalisation, I know), have a tendencies to grab media attention. Sometimes it is necessary to correct the imbalance of nature man has created, hey we are caretaker's I guess..

Mark

PS , pretty much covers it too.

Eradicating introduced pests like foxes and rabbits would certainly help preserve native species which have been seriously affected by these introduced species. I, for one would be happy to see them all gone as long as it's done in a humane fashion.

I'll leave it at that, this is after all not even remotely on topic, although it did generate some discussion in an otherwise dead newsgroup ;-)

What he said, as near as I can recall, was that the answer to the world's ecological problems would be the removal of the human species - which is, of course quite accurate - if you ignore volcanoes and such ! In any case, I am quite sure this left lib looney has written similar crap in some of his lately published inane drivel !

5835. Now, sincrap tell me the iMac has not run out of steam.....

Newsgroup: comp.sys.atari.advocacy
Date: 2001-01-20 15:20:44 UTC
From: Tom Elam <telam@iquest.net>
Message-ID: <razor-8E42A8.10204420012001@bigmomma.idirect.com>
Source record: 1300

see the pro-Mac:

http://www.maccentral.com/news/0101/19.apple.shtml

iMac sales in Oct.-Dec. 2000 fell to 308,000, down from 702,000 in the same period a year ago and 571,000 in the July-Sep. 2000 quarter. That's not a drop, that's going over a cliff. In fact, while the article lacks complete data, full year CY 2000 iMac sales must have fallen well short of full year CY 1999.

Sorry guys and gals, but the iMac boom is over. Better go out and find some REALLY cute new colors! Quick!

And the Cube? 107,000 sold in the launch quarter, then a paltry 29,000 in Oct.-Dec. This puppy will get dropped. It's worth about $799, and Apple probably can't even make it for that cost. If you read the whole article the average revenue yield of a Cube was only $482 last quarter, down from $1542 the quarter of launch. How can this be? Rebates plus some outright give-aways? Maybe, but as likely is that there is something strange in the Cube's $sales numbers obtained by maccentral

All in all the article paints the current situation at Apple more frankly than any I've seen on a pro-Mac site. If Apple's fans are willing to say this, might the situation be even more desperate? Will their fabled $4,000,000,000 in hoarded cash extracted from loyal, but incredibly naive, customers bring them through this crisis? Tune in next week for the next episode of the Crash in Cupertino!

Quick question:
I have an Atari 800XL system with a cartridge slot. Which cartridge format (2600/7800 etc) can I use with it? Normally I load games with my floppy disk drive, however it would be nice to have cartridges as well.

Your help is appreciated.
TIA!

The computer industry as a whole slowed down. You did not forget did
ya?

> Sorry guys and gals, but the iMac boom is over. Better go out and find
> some REALLY cute new colors! Quick!

In your dreams..Apple knew Q1 would be rotten and decided to put the
breaks on production to keep inventory lean and not have bloated
inventory problems at the first of the new year. Apple disposed an
additional 300,000 units during Q1. Reports indicate that iMac
inventory is difficult to come by as a result.

I disagree. I think $1299 is the proper price considering that the new
G4/466 is now $1699.

5846. crapple's quarterly report: sincrap says UNCLE!

Newsgroup: comp.sys.atari.advocacy
Date: 2001-02-14 19:09:00 UTC
From: dss96@aol.com
Message-ID: <razor-D90D82.14090314022001@bigmomma.idirect.com>
Source record: 1211

so much fer sincrap claimin' dat crapple do better - despite da gingerbread an' the attempts ta play catchup wit' rest of PC World, dey're goin' furder down da crapper. Down 57% in americas, down 48% in europe, down 80% in japan.

perhaps now dat dum loser troll admit defeet an' crawl back under his rock?

We all know Apple has had been going through some ruff times, but it still interesting to see the actual numbers. You can find the report at http://biz.yahoo.com/e/010212/aapl.html

Here's the breakdown by region. I wonder if Altivec is even powerful enoungh to even keep counting up all these losses?

AMERICAS AND EUROPE

The operating results of these two segments reflect the Company's overall results. Net sales in the Americas segment during the first quarter of fiscal 2001 decreased $676 million or 57% compared to the same period in 2000. Macintosh unit sales in the Americas decreased 54% on a year-over-year basis. Net sales in the Europe segment decreased $300 million or 48% during the first quarter of 2001 as compared to the same quarter in 2000, while the segment's Macintosh unit sales decreased 41%. These two segments combined represent approximately 83% of the Company's total net sales during the first quarter of 2001 and account for approximately $103 million of the Company's total operating loss for the first quarter of 2001.

JAPAN

Net sales in Japan declined 80% or $328 million and Macintosh unit sales declined 74% during the first quarter of 2001 as compared to the same quarter in 2000. The Company's Japan segment was most impacted by the Company's plan to reduce channel inventory during the first quarter of 2001 which is reflected in the 91% decrease in unit sales of iMac in Japan during the first quarter of 2001 compared to the same quarter in 2000.

The whole PC industry ended the last three months of 00 in the dooldrums. Apple ended the year with 5.5 weeks of inventory down from 12. Drying the channel and creating cash on hand is the plan.

Apple's inventory was low in Jan which would be the reason for the decline of sales..

Nice Try...

look like crapple still snail compared ta Pentium, accordin' ta professional Carmack. look like sincrap need ta find life.

http://www.insidemacgames.com/news/story.php?ArticleID=2184

Carmack on the 733Mhz G4:

"We did a ton of testing the last two weeks while we were putting the demo together.

The 733 G4 was not as fast as my 1 ghz PIII in any of the trouble areas.

Apple is doing a lot of good work, but the CPU's just aren't as fast as the x86 ones.

AltiVec can compensate in some cases, because it is way, way easier to program for than SSE, but it takes a very simple batched, computation intensive task for it to pay off in any noticable way.

Amdahls law and all that.

We did a couple functions with AltiVec, but they didn't make much difference.

Video encoding and large image processing are two areas that it can pay off, because you may be spending 90%+ of your time in one page of code.

Even then, it takes a special balance to let a G4 come out ahead, because it has less memory bandwidthd than a high end x86 system."

5850. I'm baaaaack!

Message-ID: <Daan6.4362$O46.10730@newsfeed.intelenet.net>
Source record: 1215

I recall a time, not too many months, when I got everyone into a fury over my desaire to see Atari reborn. Well, that *may* still be possible, but I'm not going to tout it with any conviction unless I get a reply from Infogrammes stating something positive towards my inqury to them.

However, I am here now, to state with utmost certainty, that a 68040-based Atari system CAN get be used to browse the Internet perfectly fine...

In theory.

You see, if the 68040 and a 486DX are theoretically similar, then the fact that I am using a 486 to browse the Internet, means that a 68040 should also as well.

It comes down to only a few things you need.

1) A good OS that doesn't eat tons of RAM nor take up tons of HD space.
2) A good Web Browser that does likewise.
3) a nice, relatively fast hard drive (420Mb or so is fine)
5) a 2-4Mb accel. 2D video card (or chipset) with drivers for said OS
6) a 56Kbps modem

This setup (I'm using a 486DX2-66 with Win95/Internet Explorer, 16Mb of RAM, 420Mb IDE HD, a 2Mb ATI Mach32 video subsystem, and 28.8Kbps modem, etc). I fully plan to prove that such a minimal system can, indeed be used to browse the Internet just as well as a completely decked out modern system.

With that done, I may decide to implement my findings in some other way...

Jared

Does the Milan040, when browsing web sites, stutter (i.e. not scroll pages smoothly) when scrolling web pages? This is usually caused by an insufficient video subsystem that can't handle the video bandwidth.

Jared

5859. Submission to Infogrammes...

Newsgroup: comp.sys.atari.advocacy
Date: 2001-03-03 01:00:20 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <EmXn6.69$lY1.20893@newsfeed.intelenet.net>
Source record: 1224

I have recorded a sample "radio ad" for Atari. I'm going to save it to floppy and submit it to Infogrammes in a few days. Here's to hoping they like it and decide to do something positive with my ideas/suggestions.

Naturally, I relinquished all ownership of contents, in the letter, just in case they have a "no outside subbmissions accepted" policy, which would probably kill the letter before they even listened to the audio file!

If anyone wants to hear the 30+ second spot I recorded, just ask. I'll Email it to you. It's about 800K in size. It sounds pretty bad (audio quality-wise), but I think it really expresses the excitement I think Atari's revival could bring to the masses...

Jared

> that should reasonably mean far more than just the equally hyperactive
> Derek ;-)

there actually is only one drooling idiot pro-Mac troll I know of.
His name's Peter Sinclair, but he more commonly goes under the name
"sinclap". The funny thing is, he doesn't frequent the Mac or Windows
forums at all, but he resides in most of the Atari forums, mostly
comp.sys.atari.advocacy (he USED to pollute comp.sys.atari.st as well
until he was reprimanded by his ISP at the time for violating the
group's charter against MCIBTYC posts).

sinclap's main angle of attack is calling all Atari users "jihads"
and ridicules them for still using their legacy systems. He also claims
to be an "Apple Power Rep", employed in some way to sell Macs, however
his extreme stupidity and his lack of spelling skill belies the fact
he'd have a hard time holding a janitorial position much less a position
selling any sort of computer, and he absolutely refuses to give any
proof of his employment.

He's also a very poor debater - when he's shown up for the vast
number of mistakes, gaffes and outright lies he's made, he immediately
goes into personal attack mode, which includes attacks against personal
appearance, obesity, sexual proclivity (he considers himself quite a
"stud", forgetting to put in the "pi" in the middle) and working
position. Indeed, what is most funny is his many tirades against Canada,
which is where the majority of his most mortal "enemies" reside - he's
suffered a lot of damage when he's done that.

Since he's been around doing the same sort of thing for the last
eight years, Atari users consider him these days to be nothing more than
someone to have sport with - they find it fun to poke this troll with
sticks until he squeeks. And the number of Mac users who've run into
sinclap are surprised that someone who claims on his side can be so
dense - he's even gone as far as saying that all 68K Macs are junk and
should go into landfills, he's claimed that Mac OS 8 was pre-emptive
multitasking, etc. ......

In other words, he's pretty much proved himself to be a premier crank and a "kook". :)

Maybe Mayor would like to debate sinclap? It wpould give Mayor a chance to debate someone his own age and IQ, and his own home state (sinclap hails from Indiana as well).

I have seen him flit through here on great occasion, typically dogging
you (IIRC). There's another pro-Mac troll ranging through Usenet who's
just about as dense, and here's what I think we should do about them.
We should take up a collection, buy them PCs running Win2K, and replace
their glasses with inward-reflecting mirrors to replenish our dwindling
supply of windroids. Actually, this would be very inexpensive since
it's the lobotomy that is the expensive portion of the conversion and it
seems these Mac trolls have already had that done elsewhere ;-)

>
> sinclap's main angle of attack is calling all Atari users "jihads"

Does sinclap live downwind of the Mayor? That would explain a lot! ;-)

[I'm making light of this guy, Daniel, but I earnestly hope _you_ don't
take offense. I grok that sinclap's irritated you... but take it from
an old sporker: they can shoot, but only you can let them score.
Laughing at him is the best response, IMHO. Never take them seriously.

As rather dramatically shown by the gavotted Gavster here, insipid
trolls hate that even more than being ignored.]

yes, that's right. The poor pathetic slob is so starved for attention
that he just wants to goad me into a fight here. That or he's fanatical
about "getting even" with me for the amount of damage I've done to him
over the years in pointing out his many failings, misunderstandings, and
just plain lying. Of course, couched in satire in pointing out the holes
in his arguments and wild claims.

It certainly helps that I've caught him with his foot in his mouth
many times, like the time he said that "if Steve Jobs ever comes back to
Apple, he will destroy the company. He is an arrogant bonehead" (of
course, when Steve DID come back, there was sinclap kissing Jobs' butt
and praising him to the skies, and vigorously denying he ever said that).

There's another pro-Mac troll ranging through Usenet who's
> just about as dense, and here's what I think we should do about them.

you know, with all the toxic fumes that burning tires give off, I
would imagine that's how the whole sad story started.

Of course, my theory is that sinclap is trapped inside the Steve Jobs
Reality-Distortion Field, and the lack of oxygen there is what's
causing him to hallucinate and have bad thoughts about the imaginary
"Atari jihads" who are "out to get him" and his Mac ..... :)

>

> trolls hate that even more than being ignored.]

believe me, I have never ever taken the little weinerhead seriously
to let him ruin my day, despite his many attempts to
"character-assassinate" me - he's his own worst enemy in that regard.
sinclap's even gone as far as calling me a failure for my job (sales in
a hardware store, for which I am paid rather nicely and actually enjoy,
I love serving the public, and my bosses there appreciate my abilities)
and for being the vice-president of TAF (which, when anyone else has
found out, has commented that was pretty cool - that includes Shawn King
from The Mac Show, when I met him at Macworld Expo last July in NYC). I
and my friends in the Atari forums simply laugh at his obvious puffery
and his bogus claims about his job and his "macho" accomplishments.
Along with heaping helpings of the truth....

I, at least, can step away from the computer from time to time and
enjoy other things in life - like reading, biking, a long walk, taking
in an exhibit or a museum, or watching the Simpsons.

maybe that would be the basis for another one of your satires, Robert
- "When Mac Users Go Bad :) "

It may excite you, but to me it sounded kinda cheesy.
I doubt the masses would care about a new Atari now after all these years...
and if they looked at the proposed specs they would care even less.

People want 700Mhz as a minimum these days, not some old '040 with a
1996-era graphics card.

IMO only ofcourse.

Regards,

Clockmeister.

Erp, were you asleep when the results of an independently-conducted recount
revealed that Bush *won* Florida. It was just last week.

Not to say I'm thrilled, but just to clear up that point.

actually it also prove sincrap's brain takin' dirt nap. sincrap also
lie as always - he claim dat al bore would win in landslide. just like
he say he no say he call jobs "arrogant bonehead" who'd "destroy crapple
if he ever come back".

sincrap an' al bore even match - both liars who' re big crybabys
when thing don't go dere way. oh, wait, me take back - at least bore
admit him big liar.

Thanks for posting that. I'd checked it out before & it does look pretty promising. I'm sticking with my PSX for now & waiting for the X Box & Indrema (if it make it out) & will probably decide between those two. I do hate Bill Gates, Windoze, Micro$oft & generaly all things IBMish but I gotta say, it sure looks like the X Box will be the next big system. I'd sure like to see the X Box & Indrema split the market. Nothing against Sony but I'd say after 6 years of Sony domination I wouldn't mind a little change.
Later,
JJH

Please let us know what they say..... I have done this sort of thing also.
I have written many letters to software companies asking them why they did
not make Atari versions of their programs. I admit, most said they would
pass on Atari, but a few did come around...

Looks like a glorified PC? Personally I wouldn't bother. The fact that the
Dreamcast has CE on it, means I won't buy it either. Who wants the hassle of
potential hardware failings because it is based around substandard hardware?
As far as I can see the best successor to the Jag is N64. Ahhhh Goldeneye.

Will be run off of Linux. Supposely you can download the development
software to develop games. You probably can call it an open source
console...

Nah its a open source PC, already got one. No custom trickery at all, how
boring. Now the Gamecube will have a PPC gecko chip in it, that's a console.

Ah, but they used the dodgy method of counting 'overvotes,' i.e., counting every vote for Gore AND Buchanan as a Gore vote, which was never going to happen in any of the recount scenarios the Gore team went for, and would never have been allowed. The previous count, where Bush won, included all hanging chads, dimples and even a mark anywhere near a candidate's name. This is considered the most liberal interpretation , with the exception of its exclusion of the overvotes.

Myself, I went for the only worthwhile candidate -- Ralph Nader. And I'll do it again.

5882. Low End Mac has page on Atari ST/Magic Sac/Spectre GCR!

Newsgroup: comp.sys.atari.advocacy
Date: 2001-03-15 14:35:54 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-91DA57.09355315032001@quark.idirect.com>
Source record: 1250
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.mac.advocacy

Good grief, an unlikely web site has written up nice things about the ST!

Low End Mac, a well-known and respected source of information and daily news for Mac users of all stripes from the original 128K models to the current Cube and iMac models, has dedicated a page to the Atari ST and related models, giving specs and even some links to Atari resources like Hallvard's Quick FAQ.

Why? Because of the fact that during its heyday the ST could, with the help of David Small's Magic Sac and Spectre plug-in modules and software, do a more than adequate job of emulating a Macintosh, and for less than what a real Mac cost at that time. :)

Check it out and see what you think - it's at http://lowendmac.com/clones/atari.html . Might not be a bad idea to contact Dan Knight, the owner/maintainer of the site, and give him some positive feedback as well as any suggestions to improve the info on the page.

One can't help but thinking that The iDiot Forever Known As Sinclap will need a change of underwear after taking a look at this site - especially as it defeats his one-man campaign to denigrate the ST, as well as all 68K Macs still being happily and productively used daily by their owners, as "junk". There's a lot of great links there on software, hardware, upgrades, etc, that'll keep those Macs running long into the next few decades. Will TiFKAS now start a disinformation campaign (complete with character assassination, long rambling diatribes against imaginary "jihads" who are "out to get him", and poor spelling) against LEM now and shoot more holes in the foot which isn't in his mouth ? :)

5885. ATARI 8-bit 256k ICD MIO with SCSI hard drive Item #1221210739

Newsgroup: comp.sys.atari.advocacy
Date: 2001-03-17 05:33:54 UTC
From: gmccla1n@swbell.net
Message-ID: <3ab2f68e.7362865@spamkiller.newsfeeds.com>
Source record: 1247

The ICD Multi I/O board (MIO) is a complex peripheral device which
adds exceptional power to the Atari 800XL or 130XE computer. The MIO
gives the user five additional hardware functions not available
with a stock 8-bit Atari computer. These are: a parallel printer
interface, a serial interface
for printer or MODEM, a printer buffer, a bootable RAMDISK, and
an SCSI/SASI interface for hard disk drives. An optional sixth
function (80
column board) may be added at a later date. This 256k MIO was
used to run an ATARI BBS quite a number of years ago and was working
fine when
it was stored, It includes the MIO base unit,Instruction manual,
software,SCSI hard drive Seagate 1096N and SCSI cable. I couldn't find
the power
supply adapter. This needs an adapter to use on the 130XE.
SHIPPING IN USA ONLY. Payment must be received within 7 days of
auctions ending.
Shipping charge USPS MAIL $10.00. PS:The ICD/FTe Multi I/O (MIO),
all versions, can use both AC and DC supplies. But stick to voltages
of at
least 6.2-7.2 V. **AUCTION ENDS**

Replace the word Apple with Atari and that looks to me like a very good
description of your posting style.

Not everything can be magically transformed into the equivalent
altivec code. OTOH, you can get dual 1.5Ghz PC's now and you can
get CHEAP 1.3Ghz Athlon systems as well.

Apple simply isn't keeping up. At any pricepoint, PCs can beat
Apples by a wide margin. This margin grows as the Apple reference
systems in question increase in cost.

--

Also while the herd mentality is certainly there, I think the
nature of software interfaces and how they tend to interfere
with free choice is far more critical. It's not enough to merely
have the "biggest fraternity", you also need a way to trap people
in once they've made a bad initial decision.

You can even get consumer PCs in that sort of configuration, and
even build your own "bookpc". My wife's WinBox is just such a
machine.

--

Ease of use should be associated with things like "human engineering"
and "use the right tool for the right job". And of course,
"reliability", since stopping to fix a problem or starting over due
to lost work are the very antithesis of "ease of use".

The LGPL does infact tend to be used instead of the GPL in instances
where merely reusing a component, while not actually altering that
component, would be unecessarily burdensome to people seeking to
build their own works.

This dramatically alters the nature and usefulness of Free Software
in practice, contrary to the 'all viral all the time' fantasy the
anti-GPL cabal here would prefer one to believe.

I've scrolled web pages just fine on some really skanky PC
hardware running on really crusty old PCs (486 VL Bus).

[deletia]

An 040 is more than enough for the web, even with the crappiest
video chipset you can come up with.

--

Ease of use should be associated with things like "human engineering"
and "use the right tool for the right job". And of course,
"reliability", since stopping to fix a problem or starting over due
to lost work are the very antithesis of "ease of use".

Your standard for web browsing must be moderate, then. When I use a 486SLC-2 system with 8Mb of RAM, a 512K VLB video card (Cirrus Logic chipset, I believe), and a 28.8 modem, I get some fair scrolling, but far from smooth in my estimation. I believe more RAM and a slightly better video card would do the trick, however.

Why should they? Speed isn't every thing. What about efficency? If a piece
of mac software can do something in half the time as an equivelant PC that
would be enough for me. Incedently there is a dual Athlon chipset being
produced too;-) Bye bye intel hahahahaha

No video ram isn't the answer. I actually get annoyed by people who insist
it does. It will only improve your colour depth. A faster video card or
faster bus is the cure. Pc's suck.

Hmmm, on a Mac no doubt it does - but I was talking about a platform with
real support for alternative OS's and software.

Not that I'm a Linux fan...

Lot of the unix types may go X. The major software firms will have X
apps in the days, weeks and months ahead. Incredible support. Waiting
for Carmack's offerings...

Mac OS X vs. Linux: Could Apple Take a Bite Out of the Penguin?

by Chuck Toporek, O'Reilly Open Source editor
<http://mac.oreilly.com/news/macosx_0301.html>

Is Mac OS X a Threat to Linux?

On March 24, Apple Computer, Inc. released its next-generation
operating system, Mac OS X (the "X" is pronounced as "ten," for the
version number of the operating system) to Mac addicts around the
world. While this isn't such a big deal to some, others view it as a
new beginning that could squash all thoughts of a desktop Linux for
the general public.

What's this, "Apple out-maneuvering Linux?" you say? Well, maybe not
as a server platform for the immediate future, but just think about
this for a second: Would it be possible for Apple to deflate the
hopes and dreams of developers worldwide of bringing Linux to the
desktop? The short answer to this is yes, but it's more complicated
than that.

Comparing Apples with Penguins

Aside from the fact that an apple is a fruit and a penguin is a
flightless waterfowl, there used to be a big difference between the
Apple Macintosh operating system and Linux. Apple had a nice GUI;
Linux did not. Linux had a command line; Mac OS did not. Linux is a
multitasking OS that supports multiple processors; Mac OS is not.
Linux runs on just about anything these days; the Mac OS runs on,
well, Apple equipment. Linux is free (well, sort of, depending on
your method of install); Mac OS X will set you back $129.

So, the lines were pretty clear about the differences between Linux
and Mac OS. But lately, that clarity has been blurred as Apple rolls
out Mac OS X to the public. The new Mac OS now has preemptive
multitasking and support for up to two processors, which is still a
far cry from Linux's support for up to 16 processors, but it's a move
in the right direction.

Traditionally, the only control Apple users had over their system was
via the Control Panels and scripting system functions with

AppleScript, MacPerl, or ResEdit. However, with Mac OS X's BSD base, Apple users were given something they've always wanted: a latch to take a peek into Apple's core.

At the core of Mac OS X is a kernel built on the Mach 3.0 kernel, BSD 4.4, and Darwin (Apple's open source kernel project), giving network and system administrators the ability to use Unix programs and add them to their Macs. When combined, these components offer a rock-solid operating system that's hard to beat. (OK, I know that Mac OS X has its fair share of bugs, so no flames, please.)

One of the advantages of Mac OS X is that it now offers Macintosh users with a command line on top of a slick, stable GUI, known as Aqua. With OS X's BSD core, Macintosh users will now be able to use GNU software. This means they will be able to run tools like Emacs, vi, Apache, and even XFree86 and the GIMP (something that Adobe Systems should fear). If you're looking for a place to download ports of GNU tools that run under Mac OS X, you should visit the GNU-Darwin Project on SourceForge.

One of the downsides of OS X is that it requires you to have a native G3 or G4 processor. This means you have to be running a G3 Mac, an iMac or iBook, a PowerBook G3 or better, or any of the G4 models and above. So, if you have an older 604 PowerPC-based Mac, you can't run OS X (that is, unless upgrade manufacturers, such as Sonnet Technologies release updates to their processor software). For now, though, if you want to run OS X your best bet is to run it on native hardware.

One group that stands to lose a chunk of the market is the Mac-based Linux distributions, such as MkLinux, LinuxPPC, or Yellow Dog Linux (YDL) from Terra Soft Solutions. Up to now, these were your best options for running Linux on the Mac, with LinuxPPC and YDL leading the pack. But OS X changes this landscape significantly. The downside to running Linux on your Mac in a dual-boot configuration (as with Windows) is that if you want to access any of your Mac apps, you had to either reboot, or install and run Mac-On-Linux. Neither option is ideal, but now OS X allows you to work in the command line, and run your Mac apps right along with them--no rebooting required.

And if you're wondering whether you can run the X Window System on top of Mac OS X, take a look at the XonX Project, which offers instructions on how to install XFree86 so you can run X Windows on Mac OS X. You can also read more about the XonX Project on SourceForge.

A Tale of Two (or Three) Desktops

So how does this make Mac OS X a threat to Linux? If you've given this any thought, the answer is quite clear. One of the challenges that the Linux community has been plagued with in recent years is the development of a stable and easy-to-use GUI. While some view X (or

any GUI) as a hindrance to Linux's performance, a usable interface is a necessary evil if you want to convert users from Windows. And while the Linux kernel might be stable, the GUIs are, at times, buggy and less desirable for most people.

There are two main Linux GUI projects underway, GNOME and the K Desktop Environment (or KDE). There are also two companies vying for bragging rights to bring services to the GNOME desktop: Ximian (formerly known as "Helix Code"), and Eazel.

While Eazel isn't necessarily a desktop environment (DTE) on its own--it's a file manager (Nautilus) for use with the GNOME desktop--it plays a vital role in shaping the future of the desktop for Linux. The driving force behind Eazel is Andy Hertzfeld, the originator of the Mac user interface, and his plan is to make Linux more "usable" for the average Joe. While Eazel has been doing some really fantastic work, it has recently been hit with the deadly Silicon Valley bug, which forced the company to let go of 50 percent of its staff shortly after releasing Nautilus 1.0. Now, part of this can be attributed to lagging development with the GNOME desktop and changes to Bonobo (the GNOME architecture for creating reusable software components), but it's still a painful experience that makes us realize that Linux on the desktop is further away than we had all hoped.

Both KDE and GNOME are working on providing a better Linux desktop: KDE2 was recently released, as was GNOME 1.4. But both rely on different toolkits for development, both have different features, and neither is really all that stable. For example, the GNOME 2.0 desktop, which was expected to be out by the end of 2000, is faltering and probably won't see the light of day until near the end of 2001. The bigger issue is that as the Linux desktops stabilize they still have one problem to overcome: limited applications for users.

GNOME and KDE both have Office-like application suites in the works. KDE offers KOffice, and GNOME offers a combination of AbiWord for word processing, Gnumeric for spreadsheets, and a variety of other tools. However, the main contender for Office-like applications is StarOffice, which is now being developed by Sun Microsystems' OpenOffice project. Sun acquired StarOffice last year from StarDivision, and made its source code available to allow further development. Even StarOffice (at least in its current form) has its pitfalls, making it a suitable option for swapping Microsoft Office files, but only if you're willing to lose some vital information or do without a certain level of functionality.

In my opinion, Apple's Mac OS X has the best of both worlds. It allows you the ability to run traditional and widely used desktop applications, such as Microsoft Office, while at the same time giving you the power and strength of BSD Unix to run GNU tools under (or on top of) OS X.

As you can see, Linux has a way to go before it can truly be accepted as a desktop platform. Users need a more stable desktop and applications that work better with what 90 percent of the world uses. We're getting there, but realistically, it'll be two or three years before we start to see Linux being used more on the desktop.

So, will people start to move away from the "Linux-on-the-desktop" mentality and migrate to Apple's Mac OS X? It's hard to say, since it still requires you to have native Apple G3 or G4 hardware. If Apple were to migrate its OS onto x86 hardware, yes, Apple could take over the desktop market with Mac OS X. Apple just has to play its cards right--and soon.

As a, mostly Mac, user - all I see in OS ten is a terrible amount of bloat - aside from a bunch of 'cutsie' graphics !! Maybe "Carbon" and "Cocoa" applications will show their value - but, my gawd, 2 gig of hard drive space for the bleeding OS - come on !!!!

Bloody pity that Atari is gone !!

5906. Help! using makedisk to transfer .st images to 720k floppies.

Newsgroup: comp.sys.atari.advocacy
Date: 2001-04-16 22:35:51 UTC
From: John Price <g.price11@ntlworld.com>
Message-ID: <atKC6.9704$cf5.953501@news6-win.server.ntlworld.com>
Source record: 1171

I'm trying to make st bootable floppies of .st disk images using makedisk.
The formats makedisk detects and trys to use for the disks are often 800-
820 k in size, and the disks never work cos there are too many errors.
I'm aware that automation etc used odd formats to get a lot on a disk, but
it seems odd.
Does anyone have any success in using this prog?

5907. OS X silences the Jihads!

actually, The iDiot Forever Known As Sinclap is an endangered
species, namely the Drooling Mac Zealot. Its species has since evolved
past it into somewhat more informed, tolerant creatures (indeed,
recently MacAddict magazine proclaimed people like Sinclap to be nothing
more than dinosaurs whose puffing and insult tactics in public forums
like c.s.a.st are an embarrassment and a detriment to Mac evangelism).
Even those in comp.sys.mac.advocacy who have made the rare glimpse of
Sinclap in that forum realize that it's a maroon, especially in light of
its recent pronouncement that all Macs that use a 680x0 processor are
"junk".

It could be possible that Sinclap may be doing its usual puffing and
bellowing in order to find a mate, since human females have rejected its
pathetic advances once they realized it had been disqualified from the
human race for shoving! :)

I propose that we set up a fund where Sinclap be tranquilized,
captured, tagged and set inside a proper enviroment where
anthropologists may observe its actions - like, let's say the Mac
section of CompUSA. Or even better yet, in a cage at this year's
Macworld Expo in New York, where higher evolved Mac Users may wonder at
how such a creature could exist without smothering on its own hot air,
or why this one didn't jump off a cliff in order to get away from the
imaginary "Atari Jihads" who were "out to get it".

Dan,

I have to say to say that I really enjoy your TIFKAS comments. Usually, I feel that such comments are warranted for a short time and then become boring and simply spiteful because the "victim" finally shuts up. But Sinclap just doesn't know when to be quiet and continues to be a pimple on society's butt. He deserves all of the "accolades" afforded him. Thank you for continuing to bear that torch! <vbg>

Looks to me like all you're doing is glancing through the magazine teasers and formulating an opinion - a wrong one, that is. I suggested to you before, read the magazine before opening up your yap.

As a magazine, we report the news, not invent it. We'll leave imagination to people like you.

To be perfectly honest, none. When you start paying me a comparable living
wage for putting out A-ONE, I'll be more than happy to attend the shows and
write 'em off on my taxes. And, you may as well pay my staff while you're at
it.

>how such a creature could exist without smothering on its own hot air,
>or why this one didn't jump off a cliff in order to get away from the
>imaginary "Atari Jihads" who were "out to get it".

THANKS !!!!
After a very lousy weekend, where everything that could possibly go wrong,
went wrong, reading your posting brought back a a very *big* smile on my
face... :-)

Any idea how to capture it? To lure it out of it's cave we may have to
spread a hoax story... something like "the Milan III has landed", it'll be
very hard for this creature to withstand the temptation and come and see
the latest weapon of the Jihads... since it seems to be a keen and very
loyal reader of the A-ONE magazine it's obvious that the story should be
published there as an exclusive... the Sinclap creature seems to like
exclusives.
Oh yes... once it's captured it should be put in quarantine for at least
six months, just suppose it spreads something contageous!! we don't need a
second Sinclap do we?
Reflecting on this: we better have it sterilized as well, but only in case
it turns out to be a fertile specimen of course.

Cheers from Belgium
Dennis

Dennis,

I would certainly be happy to play a role in this "creature hunt" and would
offer the services of A-ONE by carrying the bait, er story. <vbg>

-Dana @ A-ONE

BTW, I think sterilization is the proper path to take once it's captured!

As usualy your response isn't even a coherent sentence. None of my Atari gear cost me that much these days. Come to think of it my atari gear are all systems, no paying $100 for usb hub to connect more than 2 devices to the system and no paying $89.95 for a floppy drive that should've been included with an iMac in the first place. So before you shoot off your mouth again, get a clue.

Hey Tifkas,

What trade shows and press conferences have you attended in the past year? I can answer that for you.... NONE!

And thats the way it will remain since you'd actually have to leave the basement of your parents house all these years. But then you'd run the risk of actually meeting one of the many people you've annoyed with your petty diatribes.

Oh and one more thing, Dan made a good point that several mac using friends of mine have confirmed. That is legit mac users really do regard you as at best a clueless vidiot.

Hi Guys,

This may have already crossed your minds but the ultimate Tifkas bait would be an upgrade to OS X featuring GEM as the default desktop. The main problem of the tranquilizer is how it could be delivered to the basment of Tifkas parents house (aka the lair of the beast).

Hey Chunk's!

USB 4 port Hubs can be had for $32 and floppies are less than $89...But
have not ued one in years..Nice try..

A Hades exceeds the $899 iMac and have not seen the tech advanced 040
box in mn yet..

Hi James,

>The main problem of the tranquilizer is how it could be delivered to
>the basment of Tifkas parents house (aka the lair of the beast).
This should be handled with the outmost care and one should be very
cautious.. it not only seems to have parents that endure it, but now it
turns out that it even has neighbours with which it has at least some
kind of "friendly" relationship.
From this I can only conclude that it has the ability to adapt to its
environment... it has publicly stated attending several Mac shows, and
while doing so, it managed "somehow" to do this without attracting
any suspicion or/and attention to itself....

Cheers from Belgium
Dennis

The rest of the computer world uses the PDF standard. Newsletters and
reports are done on PDF now. Mac OSX has the PDF integrated were as
one can convert work into PDF with a click. Don't you want your
readers to get ahead? Makes me question the seriousness and
credibility of Atari Online News

A-ONE is not a newsletter or report. It has nothing to do with standards or getting ahead. TEXT is a format that anyone can use without the need to do anything to get it. Question all you want; you have no credibility and fortunately not someone to be taken seriously.

>> I wouldn't know - _I_ don't watch Fox News. My previous statement stands.

MAC OS has had PDF integrated for what? A month if that?
Some of us do read news and until Apple tosses classic mode from
OS 10 you should shut your yap...

No, three months to be precise...Every Mac has shipped with the PDF
reader called acrobat. What does classic mode have to do with PDF?

ah, but you see The iDiot Forever Known As Sinclap can never shut up.
It's simply incapable of it, since its sad obsession with attacking all
Atari users because of some silly slight in the past won't let go of his
brain.

Personally TiFKAS' proclamations have always been sources of hilarity.
Remember "Pointcast will destroy Atari presence on the 'Net?" It was
Pointcast instead that crashed and burned. Remember "Dejanews is the
future, all newsreader programs are obsolete?". Dejanews is now a shell
of its former self, and newsreader programs on all platforms are still
being developed and upgraded, and TiFKAS has been forced to use a
newsreader program itself. Remember last year in .advocacy when it
proclaimed "all ATI video cards are crap?" . It sure began using the
crowbar to extricate its foot from its mouth after Particle Salad
mentioned to it that ATI cards are found in most Macs including the iMac
(and it claims that someone hired it to be an "Apple Power Rep!").

Oh, and of course - "If Steve Jobs ever came back to Apple, he would
destroy the company. He is an arrogant bonehead." A message that still
haunts TiFKAS to this day, even to the point of its denying that it ever
said it while simultaneously licking Steve's boots....

3 months, geesh impressive. The truth is mac os got a complete
over haul and finally after several years catches up to MiNT.
If it was so great why replace it entirely... you are pathetic
and blind. If you knew anyting you'd know that there is a
PDF viewer for the Atari... not a great one but it works.

Pointcast was a nice idea in it's time..But MacTicker fits the bill
nicely and a site that has the most comprehensive news web site links
is the drudgereport.com.

ATI cards at the time were crap. But the Radeon card is nice and the
Rage mobility cards found in laptops such as the iBook fit the bill
nicely. ATI has come along way. But work is needed now that NVIDIA is
at there heels.

So what is A-ONE? If its not a newsletter or report...is it toilet
paper? Most of the content in the toilet paper is old news and have
been reported elsewere. Why do you miss use the Atari name when
greater than 90% is non Atari related?

So where do you add peripherals on your beloved imac, assuming you have any. For that matter where do you save files? those imac hard drives are adequate but not infinate. When its full where do your files go? in the bit bucket with the rest of your mindless drivel.

>
> A Hades exceeds the $899 iMac and have not seen the tech advanced 040
> box in mn yet..

If you'd bothered venturing out of your parents basement in the past 5 years you'd have seen one by now, both the Imac and the Hades have been available for a few years. Fact is I was able to find a Hades before I could find an iMac. But leaving your parents basement might expose you to something that terriefies you beyond imagining, something those of us in the real world call FACTS.

A more likely scenario is they'd be relieved at the removal of such an
unstable induvidual. I for one wouldn't let children play outside with
such noxious induvidual lurking about.

Claimed to attend shows. Truth is nobody has seen IT at any show this or
any other year. IT's total lack of any factual statements points in this
direction. People who do attend mac shows report events which concistantly
disprove IT's diatribes on a regular basis are an undeniable proof.

Not at all. As I've repeatedly said, I rely on verifiable FACT not you're unproveable bollocks.

> Called weeding files when not needed. Since you want to know, have a
> VST external HD for backups.
>

Try answering the question instead of avoiding it. Btw, how do you do backups? an external hd is useless for this. Removable and Writeable media is a MUST in any computer. and NO a cd-rw doesn't fill this requirement, RW mode cd's are only useable about 10 writes then its no longer usable.

> ROTFLMAO! How come I can't find a Hades down south?

Because you haven't looked!!! I get a lot of laughter from your moronic comments. FACT is I got a chance to use one at the local user group befre the Imac hit town. No doubts, no crap, just unadulterated fact. No matter how long you keep that paper bag over your head (better for us not to see you) you can't make the hades go away by hiding in your parents basement the rest of your life.

Hiya Gerrit
I hope you have the good fortune to find one of those rare STbooks.
Many including myself would love to have one as well. In my years of
being an atari nut I've only seen a single example in a dealer when they
were new. I remember it sitting next to a TT030 and having an identical
price.

So why did you previously state china was 300 milse south of your "womewhere in MN". you know sinCRAP I've been reading your drivel for a while and the more you mouth and spew lies the more you dig yourself into a hole. You lie to cover your layers of lies. Many people have pointed this out to you, yet you're the only one totally oblivious to this glaring fact. Yet you still try to bullshit your way through life. Theres no way this can work, ask Bill Palmer and the other residents of the Net.Kook archives.

It was obvious that China is not down south..Thats why the word
'currently' was used as currently in China...

Not might fault you were too densed...

My critics are a dime and dozen...

what's even more pathetic - not only does The iDiot Forever Known As
Sinclap claims that it is a college graduate - which, if this is an
example of what American colleges put out, then the USA is doomed - but
also claims to be an "Apple Power Rep", which is highly unlikely due to
the fact that real "Apple Power Reps" (yes, I have spoken to real ones
at Macworld Expo NY) require a high level of reading and writing
comprehension as a term of employment. TiFKAS is still refusing to
divulge who employs it (muttering twaddle about "Atari Jihads" who are
"out to get it").

> >
> > The next thing you're going to talk about is probably your freedom of

> speech and all that stuff many of you Americans babble about all the
> time someone criticizes you.

years ago TiFKAS would defend its constant attacking of Atari users
in c.s.a.st (which was in violation of the newsgroup charter, which
forbid "computer vs. computer" debates) by wrapping itself in the
American flag and claiming that it was protected under the First
Amendment of the US Constitution, which promises freedom of speech.
When, however, I discovered that the US Supreme Court had ruled in 1974
(in the landmark case "FCC Vs. Pacifica" AKA "Pacifica Broadcasting's
playing George Carlin's Seven Words You Must Never Say On Television")
that public nuisances were not protected under the 1st Amendment and
could indeed be subject to criminal and libel prosecution, and made that
clear in that forum that TiFKAS defined "public nuisance" to a T,
TiFKAS promptly shut up.

I find it interesting that TiFKAS is accusing you of being from
Canada, Hallvard (notice the "up North" reference) -its known emnity to
the Great White North is showing, due to the fact that a number of its
most vocal critics who have totally humiliated it in exposing its vast
ignorance of anything computer-related hail from there, often claiming
we have a lousy "socialist government", are sinking economically, and
are nothing more than "US-owned territory". It must really hurt it to
discover that currently Canadian economic growth is larger than the US,
not to mention that at least in our elections we can count, unlike in
TiFKAS' US where they allowed the dumbest politician since Dan Quayle to
become president due to a stupid concept like the Electoral College.
(It's also funny that the newspaper it uses as "evidence" of the bad
stuff about Canada, The National Post, is also considered a national
joke which has bled red ink since its inception, and that its publisher,
Conrad "Tubby" Black, has fled Canada with his tail between his legs out
of shame).

> >> If you think you're bringing "Mac-evangelism" to the world you've

> Again, I see no need to comment on this as your postings speak for
> themselves.

ROTFLMAO! well said, Hallvard!

TiFKAS is now denying that it is a "Mac Evangelist"? After all these
years of carpet-bombing c.s.a.st and .advocacy with its obvious pro-Mac
drivel? After calling users of fuji-badged computers "Atari boobs" who
"need to get laid"? After saying such things like "Calamus is crap", and

"90% of all Atari applications fall over on the Milan"? Who once claimed
that Apple, depite a BILLION DOLLAR LOSS in 1997, still showed a profit?
>
>
> >sinclap!
> >somewere in mpls
>
> Still too scared to reveal who you really are...
> Can't stand behind your worthless drivel, can you?

its name: Peter Sinclair (sometimes Peter Sinclair-Day)
its ISP - Earthlink (check the headers, that's where it's posting
from)

> Makes me wonder how many Internet providers you've been banned from....
> I'm sure this isn't the only newsgroup you've been polluting with your
> endless stream of crap.

TiFKAS has also been known to spread its reign of error in the amiga
groups, as well as the Lynx and Jaguar groups.

TiFKAS has also been reprimanded by Cedarnet.org for violating its
user agreement when it was active in attacking users in c.s.a.st (a
charge it denies, despite the fact that I was e-mailed by Cedarnet and
was told that it had been warned and reprimanded, subsequently TiFKAS
disappeared from c.s.a.st for a time like a whipped puppy), was tossed
off DejaNews for a time for posting sexually explicit content in
.advocacy, and was banned from Hotmail after it used the service to send
harrassing e-mail to one of its critics.

Speaking of dumb politicians, you have one in your neck of the woods.
What boob stereotyped Africa? All that money down the drain because he
had a dream that a tribe was dancing around a big cooking pot being
boiled with him inside.. I am sure that the business community is
amused..

There is discussion of implementing user fees for visits to the health
clinic. Seems that costs are spiraling out of control..

I was never on hot mail. You must mistake me with another. As for cedarnet, I was never reprimanded with a letter... just a note that there was a complaint. Replied to the complaint note... No violation of usenet policies. Don't know what they sent to you.. If this standard was held up, usent would be as empty as the Aussie outback or the Alberta province

Funny, I don't recall seeing those words in a message by me.

Typical of you, however, you seem to have a way of turning things around to fit your agenda. When will you finally admit to yourself what everyone else has so clearly explained and proved to you: you're an asshole.

I don't have an agenda.. Maybe it's the credibility of the rag with
lack of perspective and not believeing in the publication. Sounds like
an excuse.. Maccentral.com has done it...

I have been called worse. My critics come and go..

Keep telling yourself that you don't have an agenda, and you'll continue to
believe it.

Excuses? For what? I've been doing this for well over 10 years now. All for
free with no inclination to charge for it. We do it for the enjoyment and
comraderie. There's nothing that implies a lack of credibility - our
readership increases weekly.

No not in my mind. This came up several years ago when you made your bogus claims of being employed at a university and implied you were a member of faculty. Until it was uncovered you're only qualifications might get you in as a janitor, nothing else. Of course this is yet another of the endless examples of you blowing smoke from every oriface to disguise your incompetance. But then to expect more of you is perhaps unfair considering your incurable stupidity and penchant for verbal flatulence.

Another example of tifkas many hallucinations. Talking to itself is one sign of mental instability desparately needing treatment. Even that is a slap in the face who've had benefit from mental health providers. Perhaps tifkas sole contribution to the world will be as an example in every chapter of the newest crop of psychiatric textbooks now used in med school.

>
> See ya in NYC later in the month..

No tifkas, you won't be seeing him or anyone else in NYC. to see him you'd have to go there yourself. Since its been proven time and time again that you fail to appear at macworld expo and any other trade show, its not surprise to realize you won't be at this one either. Take the hint, if you did go, you'd be quickly banished at the door. The Mac community doesn't want you, the Atari community doesn't want you. NOBODY WANTS YOU because your a useless idiotic blowhard.

Yes, at one time I was employed at the University in the IT group at
the libr...as the lone mac(maytag)tech person. 90% of the time was
observing the legions of windoze techs going ga ga over the new windoze
95 at the time and continous trouble shooting of wintel 3 workstattions
in staff and public stations. Very hilarious... observing the mindset
of the IT beauracracy and job security..Had my token macs out on the
network by end of business day and begun the wait tech watch..Waited,
waited, waited, waited, waited and bing...the first tech call!!
Easiest money I made. Just a restart to fix the freeze... Afterwards,
my college party career had come to an end. Still paying off the
brewsky tab though.

Yes and a big brewski tab you have. Being a drunk would explain your aberrant stupidity. But I still wonder why you persist in this lie when it was disproven years ago. People have checked and you never worked there. But for us in the REAL WORLD we dont go to college to party and be an idiotic buffoon as you are but to increase our knowledge. This is why your the only one clueless to one blinding fact, that is your own ignorance of the real world.

6015. If you could design a $300 homecomputer today, what would you choose?

For the sake of argument let's suppose you could design a next generation $300 homecomputer. The goal is to make a userfriendly machine for general use and for hobbyists. How would such a system look?

CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this type of thing, you should be looking at the $20-35 level)
As OS? (Linux is a dead giveaway, but there also other OS's out there)
Build in programming language? (please choose anything but Basic!)
Amount of memory? (RAM and ROM)
Graphic and Sound?
Network capabilities? (internet capable)
Plug in capabilities (remember you're making it as cheap as possible so modems, CD-Roms, HD's are all extras)
Video (TV? or Monitor?)

Remember that the RETAIL price should be $300, so think in wholesale prices. The real costs should below $200 or even below the $150 level. You may presume that a million units would be manufactured so take volume discounts for components into account

Let's see what sort of systems people come up with.

Well, in quantities, you might get pretty close for low end
Celerons....
>As OS? (Linux is a dead giveaway, but there also other OS's out there)
FreeDOS?? It's getting closer to be usable everyday....
Linux for a home user, no way, not in this decade AFAIAC... ;-)))
>Build in programming language? (please choose anything but Basic!)
What's wrong with BASIC? It's easy to be "build in", as it is an
interpreter and there are a lot of BASIC variations out there that
would stand any comparison for ease of use and performance....
Or you you suggest something more academic like Smalltalk, Lisp or
Java???
>Amount of memory? (RAM and ROM)
Not as much a question of cost (128MB SDRAM is less than $10 these
days), as of a combination of the above specs...
>Graphic and Sound?
VGA style graphics with 4MB RAM and at least 800x600, 16bit colors is
not a problem these days either..
And SB compatible sound probably not...
>Network capabilities? (internet capable)
an onboard solution with a Realtek chip and TP 10/100 RJ-45
connector...
>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)
>Video (TV? or Monitor?)
Well, a monitor is probably the most expensive part. As for the
possible graphics capabilities, a TV (if it's not a fancy digital HDTV
one) is far below the capablities of the graphics chips...
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
If you buy a million pieces of ANY component, you get FAR below the
usual retail prices. a quick look on pricewatch reveals

CPU: AMD Duron 700Mhz $24 (Celeron 700MHz $42, VIA Cyrix 700 $37)
Memory: 128MB PC133 $9
Mobo: Intel 810 $38 (build-in video!, USB, keyboard,...)
case w/ p/s $25 (ATX desktop)

Ok, that is a pretty mix, bu assuming large quantities as you
mentioned, this is less than $100 for the major parts. Add a few $10
for network and sound and smaller stuff, no problem...

>
>Let's see what sort of systems people come up with.
>
Ok, just a rough sketch, but it should give you an idea.
The problem is to finance this and to get the software for it (BeOS
might be nice, but....)
And these days, you will have a hard time selling something that is
not Playstation or PC compatible...
And than you are up against M$ with their XBox or whatever it is
called these days......

just my 2c,

Ralf

You need to make your mind up. Either it's a toy - and at $300 retail
that's all you can aim for - or it's a computer for "general use and
for hobbyists".

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

Very cheap and weak Intel or AMD CPU's then. The alternative is to go
with the stuff used in PDA's, but do you want to have a desktop or a
PDA.

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Like QNX maybe, or a ported version of AmigaOS. Other alternatives
rake you back to the PDAs.

>Build in programming language? (please choose anything but Basic!)

gcc for real programming, Perl for scripting.

>Amount of memory? (RAM and ROM)

Depends on the OS. No ROMs, they stink.

>Graphic and Sound?

There are plenty of cheap chipsets.

>Network capabilities? (internet capable)

Built-in 10/100 BaseT. Essential.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Don't be daft. There's no point making CDROMs and HD's "extras".
What, you think people are willing to go back to swapping floppies?

>Video (TV? or Monitor?)

Again, are you after a computer or a toy?

>Remember that the RETAIL price should be $300, so think in wholesale prices.
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
>
>Let's see what sort of systems people come up with.

What's the point? This is market research for the '80s. Nowadays
people aren't satisfied with a cheap jack of all trades that doesn't
do anything very well. They want a cheap games machine, they buy a
console. They want a cheap general purpose computer, they get one.
They want something cheap that does everything well, they get into a
time capsule and go back to 1985.

Anyone aiming to produce computers that retail at $300 is going to be
peddling a pile of camel dung.

Two points.

Firstly, what's so bad about Basic? It's entirely possible to write structured programs in any decent dialect (BBC Basic being a case in point), and the mere posession of a GOTO statement is not in itself the mark of the devil.

Secondly, why does there have to be only one built in language? Look at the BBC Micro - 4 ROM sockets (expandable to 16), allowing you to have several languages resident at once, switchable by software commands (eg *BASIC or *PASCAL).

[1] Yes, I do own one, and it's great.

It would probably look very much like the e--Machines system I just
bought my daughter to take to college with her.

600Mhz Celeron
32 MB RAM
8Mb SVGA Video integrated on motherboard
Soundblaster compatible integrated on motherboard
10 GB Hard Drive
16x DVD
Keyboard
Mouse

Cost? $269

(OK, I got a deal because these were "returned" systems from a company
that canceled a contract. They had to be sold as :"ref urbs" because
they weren't "new". Big deal.)

Oh, and I added a 10/100 card for $14 and 256MB RAM for $55

She probably could have gotten by without the RAM, but why?

The price is in the $300 ball park and it's a system she'll be
familiar with and can make instant use of. The software it runs will
be compatible with most people she runs into in college. It has a
software base that no new computer could challenge for decades.

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

And looking at incompatibilities? Let's choose something no one else
runs at present just to be different? Something with no software
base? Something that will have to run an emulator (and slow it down)
in order to have any programs to run?

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Gak. You said "userfriendly" up there. Linux is out. Waayyyy out.

>Build in programming language? (please choose anything but Basic!)

Why not? BASIC is userfriendly. It uses natural language. It was
designed to be easily usable.by anyone.

Why choose something that will only discourage users from learning it?

>Amount of memory? (RAM and ROM)

RAM is cheap. More is better. Decide on the actual amount at the
last minute depending on the final cost of the unit. Put in as much as
you can to bring the cost up to your final limit.

ROM is nice, but restrictive. Atari was hobbled by the difficulty of
releasing bug fixes to its TOS operating system because the OS was in
ROM. (Well, that was one of the reasons.) But it was VERY nice to
have the system boot in seconds.

>Graphic and Sound?

Yes, definitely.

>Network capabilities? (internet capable)

Of course.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Why? When you can buy a system like I described above. Who is going
to buy a stripped down box? Will it have a cassette interface?

>Video (TV? or Monitor?)

Using a TV will restrict the output to 40 columns. Nice if you're
currently using a VIC-20, but who is going to do anything but play
8-bit games on a TV?

>

Well, I've already got mine. (I'm designing roller coaster tracks
on it right now. I'll probably take that off before it goes off to
college with my daughter though.)

hmmm... I think "Next Generation" and "$300 Home computer" are diabolically opposed.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

AMD Duron 700MHz, 24 bucks. Powerhungry? who cares, I have a wall socket.

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Optional, included OS's are evil.

> Build in programming language? (please choose anything but Basic!)

"Next Generation" and "built - in" are diabolically opposed, why plan for obsolescence? (and what's wrong with Basic?)

> Amount of memory? (RAM and ROM)

256MB PC133CAS2, a whopping $50. To hell with ROM, ROM only seals the fate of the shortsighted. Anything "Next Generation" should have no ROM, hell, even the BIOS is going the way of the dodo.

> Graphic and Sound?

um, yes. ;)

> Network capabilities? (internet capable)

yes.

> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)

It's cheaper if they're NOT extra's.

> Video (TV? or Monitor?)

Grown men don't find sitting indian style on the floor in front of the family TV acceptable. Monitor, please.

> Remember that the RETAIL price should be $300, so think in wholesale prices.
> The real costs should below $200 or even below the $150 level. You may
> presume that a million units would be manufactured so take volume discounts
> for components into account

Why $300? If I want "Next Generation", I'm ready to pay for it. I'd rather pay $3G for a useable PC than waste $300 on something crippled to "cut corners" that doesn't do what I want. Money is /hardly/ an entry barrier these days.

> Let's see what sort of systems people come up with.

While interesting, the "Next Generation" PC will hardly be revolutionary because of its hardware or its cost. Both those barriers are /hardly/ barriers any more. The area society would most benefit is computer science research, Operating Systems and User Interface design are what will make something "Next Generation", not cheap hardware or retail price.

It should be small and cost-effecient. $300 is WAY too much. let's say
$150 is quite affordable. Also it should be able to emulate numerous of
those old home machines and the emulation be changed in software.
Nowadays it is possible to make chips by programming them.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

> Video (TV? or Monitor?)

Cpu would be Western Desing Center 65816 and a z280 or a z380. Both
would share the same memory, and there would be 16 megabytes of ram
memory and bankable one megabyte of video memory (so that it can be
mapped to either cpu's memory area). Also they could run their code
simultaneously so that when the machine is emulating a 65xx machine, the
z380 emulates the old chips in those systems while the 65816 runs the
code. Also, when a z80 machine is emulated, the 65816 takes care of
chipemulation. Also some of the memory would be relocatable in software
so that the old chips, roms and so on can be easily emulated. The clock
speed of both cpus should also be changable in software.

The programming language would be c++ or c or assembler. Also basic
would be considerable. Only needed rom would be the code starter roms
for both cpu's and a boot rom. The rest could be loaded from an ordinary
ide hard disk drive. A dvd-rom would also be a good there; it can store
much information and can possibly be used to watch dvd. Also if it is
made bootable it would be fine.

As a graphic solution a svga driver chip would be superior. As a sound
chip a creative sb16 chip would be fine. It has fm and 16 bit stereo
dsp. A ne2k compatible rtl8019 would be fine for networks.

First of all, it would be two different systems:

A "userfriendly machine for general use" could very well be a closed
machine, like e.g. the early Macintosh models. The user just wants to
use such a machine, without caring about the inner workings of it,
much like you e.g. watch TV without bothering to understand how the
TV set actually works.

A machine "for hobbyists" would be different: it would be open, well
documented, expandable, etc -- more along the line of the Apple II or
the PC's. This machine is for people who want to poke around in it.

(with apologies for the huge cut and past of one of my previous posts)
CMD made an attempt with GUS - 3 x 65816 at 20Mhz, SCPU 128 architecture and some other neat ideas. The arrival of cheap PCs killed the project. The problem with cheap PCs is that their first-time owners tend to treat it as an appliance, and paying expensive bills to get problems fixed, or to purchase entirely unnecessary application software for more than the initial purchase price of the box.

One of my favourite "toys" was an old Dick Smith (Funway?) Electronics Learning Kit. It was a board with springs (to join the hookup wire), components, and project sheets. Simple, fun, and educational. Especially since there was no need for that ten-year old to to wield a dangerous soldering iron and play with mains electricity. Which leads nicely into...

If the C64 was going to be ressurected in a modern form, it would have to be something entirely different from a PC, and aimed at an entirely different market. A "learning" or "hobby" computer. Like "Mecchano" and IIRC "Lego Robotics".

Something that was:

a) Relatively inexpensive
b) Programmable
c) Childproof and newcomputerowner-proof
d) Expandable

What I'm thinking of is a SCPU-driven 64 in a PC mini tower, with real O/S that sits over the C64 BASIC/KERNAL package and provides a protected environment for a new BASIC or PASCAL with strong visual and audio support. A component system, similar to Borland's "Delphi" would be really nice.

The O/S would be scaleable -
* A "Childrens' Mode" which allows a subset of the programming languages and lots of presets for stuff like printer output, menu-driven educational titles, etc (in ROM?). Perhaps a point-and-click programming language with built-in music to make "games" similar to the old Commodore "babysitter" titles ala "Pinball Construction Set".
* A "Hobby Mode", perhaps using a hard-to-get-at hardware switch which allows access to the guts of the machine, and 64-mode, etc. A redesigned "hobby-port", basically the User port with build-in relays and perhaps a bay for a 9-volt battery to power plug-in (out of the box) hardware projects.

In all, a machine that the user can get a real feeling of being in control - no worry about viruses or crashes or constant version updates and patches. Something parents will buy for the kids as a toy but may (hopefully) discover than by plugging some extra stuff into it, can do basic tasks like wordprocessing and may not be quite the toy they thought it was.

An internet project already exists for a "Next Generation" CPC computer, which will use an eZ80 processor (Z80 compatible), run old CPC software, be open, have a new operating system etc. See web page at http://cpcng.free.fr/ or mailing list archives at http://groups.yahoo.com/group/CPCNG (a bit quiet recently).

A PowerQUICC 862 (I'm not sure I've got the number right)
> As OS? (Linux is a dead giveaway, but there also other OS's out there)
go for linbux, it's easiest.
> Build in programming language? (please choose anything but Basic!)
why bother, just stash gcc on it's HDD
> Amount of memory? (RAM and ROM)
dunno, the stuff's dirt cheap, prolly somewhere around 32MB.
> Graphic and Sound?
Half inch a cheapo PCI SVGA chip and stick an AC97 codec on one of the PowerQUICCs serial ports.
> Network capabilities? (internet capable)
Make use of another PowerQUICC serial port.
> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)
SCSI and USB. I would *not* make an HDD an extra. They're cheap enough anyway, for a small one.
> Video (TV? or Monitor?)
Both standards, but supply neither.

No, they're cheaper these days.

What with them being a lot smaller, efficient, cheaper to produce, etc.

And I'm surround by two MIPS boxes (One is admittedly a PSone, the other is
significantly cooler - an SGI Indy), one SPARC box (SPARCstation IPX) and one
SuperSPARC box (SPARCserver 10).

These might not be be spanking new architectures, but they're superior in
every way (expect sheer clock speed) than any Intel/clone box I've seen.

>Weird. I think you should check out a recent Linux distribution.

I've been using and sysadminning Linux for the past few years, and
none of the distributions I've tried have been sufficiently
idiot-proof to put in a consumer device*. However, that doesn't mean
that one couldn't be created.

Now that I've been using it for a couple of weeks, this 'ere Debian
box behaves perfectly. I can and do use it as an appliance sometimes,
and at other times - well, there's all the other goodies there so I
can hack away.

I turn it on, and, after a minute or so, I'm at a graphical login. I
log in and I have a desktop, with common applications already on the
desktop and less-common applications in a small drop-down menu. The
Gnome panel across the top has a clock, a battery meter, and a
shutdown button, (and cos I'm somewhat more of a 'power user' than
what we're targetting, it has virtual desktops, task lists, etc as
well). It all 'just works'. And because the important config files
are protected, dumb users can't just break it. I have to explicitly
make myself root to break it.

* - nor is Windows. How many consumer devices do you have to go
through umpteen arcane menus and options to do something trivial? Not
even my VCR is as badly designed as Windows.

And what's right. You see, that's part of the initialization
procedure. For instance, if the Box ends up saying "Waiting for
Port 1 Jack" the user knows that something is up right there.

|Oh, and the audio ins and outs would be through phone jacks, too.

Yep, phone jacks all over the place.

|And when it powers up properly, and is sufficiently initialized,

As for speech recognition, or maybe just whistle recognition, that's
a whole 'nother ball o' wax. The manufacturer would be shooting
himself in the foot if he requires the user to input data (er, ah,
select games or applications) by whistling.
```

Interesting, I had a similar kit with a board, springs, components and project sheets. You could upgrade the entire board to a full experimental control system complete with well written manuals (even for a kid) how to build and design assorted circuits. Cool stuff. :-)
You could find them in some of the larger electronics stores but I haven't seen one in years (sigh). I don't remember the name but it came from a german company, the boxes they came in were orange with electronics and schematics on them.

So it should be aimed as an educational toy/tool. Seeing the cut throat PC business this would be a sensible approach.

The reason is that Basic will being a good language for beginners isn't the best language to learn the art of programming (structure, modules etc..) . I'm not up to date up to date on recent Basic dialects but I believe the same problem still applies. Once you get to the higher programming languages this becomes evident and you have to 'unlearn' before you can start again.

Don't get me wrong. Basic was a good beginners language but these days I think Python is far more suited for newbies and novices.

If it has a network interface you could use an external server for storage.
No need for floppy's, CD/DVD's then. You could register for this service at

the time of purchase. Maybe they could also include some open source solution for people who want to run their own server at home.

That's simply projecting the current situation into the future (and the past for that matter).

As for a cheap games machine. Remember it ain't the cheap hardware that evaporates your bankaccount, it's the software. If we're good honest corporate citizens ;-)

> Anyone aiming to produce computers that retail at $300 is going to be

What you're referring is an 'Uber-Console' given processor power, dedicated chips and proper emulators you could do that. But I'm afraid the $300 barrier would be broken if you include recent formats. For such a system to be legal (software piracy) a HD storage wouldn't be advisable. Instead it would have to support the various CD-formats, cartridge slots etc...straight out of the box.

It's possible i suppose but the price would be far above $300.

Cheers,

Thomas

I've tested various distro's and for the moment Suse 7.2 comes close to your ideal. The graphical setup interface is top notch. You do need a decent system to run it though, but there are plenty of other distro's for lower end systems out there. The SuSE 7.2 evaluation can be completely run from CD-ROM with some settings and some memory swap space (not necassary if you +170MB RAM) stored on your HD. This distro really is plug and play. It can detect most of the components (sound, network, video, modem etc..) and set them up correctly. If your card isn't detected automatically you just select it from the list. (I had to select my old SB16 ISA card this way) and just fill in the settings for FM, MIDI, IRQ that sort of thing.

In the end you get a perfect configured Linux system thats idiot proof. No hassle, no danger of messing up your HD. Just boot the CD for a test run. Try downloading a version to see for yourself from www.suse.com

I've been experimenting with Linux for two years now and SuSE 7.2 (and Mandrake?) is the best idiot proof version I've seen. Anyone reading should try it, it's that good.

Cheers,

Thomas

No, it doesn't... As mentioned previously, BBC BASIC had procedure and function definition... QL SUPERBASIC went one further and the procedures/functions actually defined new keywords... It also had Repeat loops and such. It was quite possible to dispense with GOTO altogether. (And this was in 1983)

Hell, even C has GOTO... It's just that its use is frowned upon to the point of flogging.

Besides that, a computer without a ROM is just a dead hunk of silicon.
Fine, the CPU will work, the memory will work, but without a little peice of
code in ROM to tell it what to do at power on, where does it get the
instructions to deal with the network or hard drive?

Does this person think the hard drive just automatically squirts data into
the CPU without any instructions from the CPU whatsoever?

Well, than you have never used a real good BASIC interpreter/compiler.
A lot of "old" Business BASIC versions are not much different than
more modern HLL. And even the BASIC used in machines like
Amstrad/Scneider or the good old BBC were a different ball game too.
Not to mention HP "Rocky Mountain BASIC" for technical apps....
Don't just think the crappy C64 basic or stuff like this... ;-)))

ok, but i also mentioned that in quantities you get probably prices

below what i mentioned from a general wholesales web site above.
>costs and the basic essentials (special casing (not just a standard box),
>cooling, cables etc...). These things eat into margins.
Well, not much cables in a modern computer, ok add another $2 and
maybe $5 for keyboard and mouse. As for materials to build it, you are
still way below $100.

There will be additional overhead, like labor, shipping and
advertising, for which i would assume even more money than the actual
labor to build it.

But the biggest catch would be to get the start with several million $
financed first, without knowing IF such a product would actually
sell...
Well, i don't have that much money to gamble with, and if i would, i
would rather lay somewhere the the tropical sun than writeing these
lines ;-)))

Actually I think it may already have been done. A group of scientists in
India have developed the prototype for a $300 computer for the masses.
Although recently a separate story proposed for India modern playstation 2
or Xbox as the basis for such a computer.
I think the current Shift magazine mentions the cheap computer prototype.
No idea what its features are.

Personally I'd like to go for £400 to allow for inflation (my a1200 cost me £330 in 94'), but for the sake of arguement I'll stick to the 300.
OS: QNX other than NASA no body seems to have picked it up as a serous concern, so they maybe more acceptive as a partner in the project.
Proccessor: Probebly a Strong ARM or similiar, they seem very light weight and shouldn't cause over heating, either that or a Hitachi proccessor 1 step up from that of the dreamcast should be ok.
Graphics: I'll got out on limb here and say the ati128 as it is happy in both TV and monitor setups.
Sound etc: a cheap media proccessor, allows plenty of playing about by hobbyists so should be good enough.
Media/storage: some sort of CDrom and a 4 to 8 gig HD depending on whats cheapist.
Memorey: probebly ddr as its not that much more expensive than standard sdram and I'm not convinced that sdram will be around for much longer. Also allows better perfomance for the graphics and media.
ports: 4 usb, 1 network connection
Ideally you want all this on one mircoatx compatible board in a dvd/vcr style box, this way you can refit it in a tower case if you so wish.
keyboard and mouse.
no tv or monitor, buy your own you cheap skate I had to in 94' why should I give you one now :P

You people are insane.
for $300 you can get a high end pentium 3 system, loaded.
for $100 more you can get a high end 1.4gig system, loaded.
and these are retail prices! that doesn't include monitor, but who
cares?

get with the times.

I don't think so. Maybe for around $600 you could
do that. What world do you come from anyway. The
gigahertz processors cost over $1000 in the store in
a built system. The processor alone would cost a couple
hundred retail.

I dont think you can build a 1gig p3 system for 300$ even if you play with rebates and get alot of the compnant for near free.
Your best bet is with a 700mhz AMD. <300$ will get you the MB (100BT ethernet, 3d audio, 2d/3d 128bit video, usb, etc, etc..) <70$,
700mhz processor <25$, 10gig HD ~70$, 256meg PC133 <25$, case/250W & keyboard/mouse/speakers ~40$, floppy/CD would be
under 50$. So like 280$ in single quantity shopping online.
Contrary to people beleif its not hard for MS or Sony to build 300$ console and actualy make some money on that initiale sale.

I personaly think a 700mhz duron kick any other processor even half its price. How much for a 14mhz 68020ec?
You are probably better off running UAE on this sub 300$ system then on a basic a1200.

The problem is with the apps and general UI system.
Dont know if its still the case, but getting to use an app,
was getting to know the programmer mind under unix for each and every app.
With OSX if you learn how to open a file in one app, great chances more then
that app will use that method.
I overhead people today in a store discovering why they PC with one click cd burning
was not working... they put the original cd in the CDRW and the blank in the DVD player.
Under linux it doesn't take much to have mass user be lost to the point that they need
human assistance. Would you be ready so offer this support to millions ?

Having a user friendly OS is more then having a tweaked kernal on a CD.

This is simply Microsoft inspired FUD from someone who hasn't used a
modern Linux distro. Try SuSE 7.2 or Mandrake 8.0 before spewing more
of this propaganda.

The scary part is that this would be trivial to do these days. If the
self-initialization procedure of the Busmaster-DMA IDE controller
simply included a "read one block from the disk into memory location
0" phase, you wouldn't really need any ROM. Just keep the CPU reset
line active until the IDE controller is done. Not that I'd want such a
system --- I don't like the idea of catastrophic hard drive failure in
the first place, but this would give a whole new meaning to the term....

Umm... go to www.pricewatch.com and click on "Processors - PC"

AMD 1Ghz Athlon CPU with 266 FSB are selling for as low as $81.

Complete 1Ghz Athlon SYSTEMs are selling for as low as $350

(Mid Twr, 20HD, 128 Mem, 50XCD, Floppy, Snd, 8MVideo, 56KModem,
2 USB, 120W Spk,KB/MS)

Like he said... it's the times...

Until those newbies start wondering why their programs don't work, and
it turns out to be because they typed the wrong number of spaces, or
confused a tab for some spaces or vice versa.

Python is a rather nice language, but requires a newbie-unfriendly
editor like emacs to keep the programmer sane.

How about Ruby?

Good DVD support? Easy to interface with 1394/DV products? Good set of USB drivers
for scanners/digital imaging? ... Easy to setup internet sharing? SSE/3dnow! Optmized
codecs?
Easy to use 'packet cd' support? How about Video IO, easy to setup & use?

If you tell me this stuff is handled better by the SuSE distribution then Windows XP I will
probably switch my home OS to linux. But other wise I wont take an afternoon to downgrade
my home OS.

If I cant use, or need to download beta driver/recompile the OS, etc... for any of my
peripherial
because the OS dont offer services/drivers I do see a problem using it for a mainstream
home OS.
Do you think linux is not on everyone computer because of marketing only?!?!?

Stephan

It is? Compare and contrast the sales of those silly 'my first
computer' things, PC/Mac-based educational software, and even a
poor-selling console like the Dreamcast.

Hmmm ... I don't think that any of these groups are the right place
for advocating any particular Linux distribution over another. Some
of them are, of course, the right place to maintain that the Amstrad
roXX0rs and anyone who says otherwise is an inferior lifeform :-)

However, I'll come out from under my bridge, take a nibble from your
snack, and say that I don't think SuSE is suitable because of its
woeful package management and questionable security.

The package management is fine for the sort of people using Linux
nowadays, but is inadequate for use in an appliance. In this regard,
I feel Debian comes closest - but is even less appliance-like than
SuSE in many other areas.

[replies to the above three paragraphs will be cheerfully ignored, as
I ain't interested in advocacy]

No distribution (yet) comes close to pleasing me wrt security*. In
this sort of device, the biggest enemy is not an outside hacker
(although they still need to be kept out) but the owner. He must be
prevented from breaking his toy whilst still retaining the ability to
use most of its functionality, including the ability to install
software. The fact that this would break his ability to upgrade the
system isn't that much of a problem. A boot-time option to either
come up normally or to do an upgrade from the net would be sufficient.
I have some fairly detailed ideas for how such a distribution could be
put together, but I doubt most people here are interested in such
arcana :-)

* - not even in terms of securing it as an ordinary Unix workstation,
let alone as an appliance.

Sad but true. One of the great strengths of X is that it does one job
- providing the ability to network graphical applications - and does
it well. Its great weakness is that it does nothing more than that
one job, and hence the proliferation of widget sets, window managers
and desktop environments leading to infinite variety and infinite
confusion.

>With OSX if you learn how to open a file in one app, great chances more then

Pity that OS X is such utter pants in all sorts of other ways :-)

>I overhead people today in a store discovering why they PC with one click cd burning

<sigh> it just ain't possible to design human stupidity out of the
system.

>Under linux it doesn't take much to have mass user be lost to the point that they need
>human assistance. Would you be ready so offer this support to millions ?

Me personally? No. I am insufficiently tolerant of idiots to do
luser-support, and there is nothing to motivate me to create such a
distribution right now. But if someone wanted to make a go at it, I
could be persuaded to work on creating and maintaining the product.
Provided he had a good business plan which would keep me in
pay-cheques for a few years.

>Having a user friendly OS is more then having a tweaked kernal on a CD.

Which is why I talked about an entire distribution, not just a kernel.
An appliance distribution is not going to look anything like a
traditional Linux distro. Sure, the end result may be a nice Gnome
desktop just like you can have with other distros, but the underlying
system will be very different.

I don't know why people insist on calling languages like python and
perl 'script' languages. Just because some people use them as that
does not mean that that is all they can do. I have written some
rather large applications in perl, and colleagues have done the same
in python. They are fully-fledged programming languages.

OK, Pentium III 1Ghz is $172.

A complete 1Ghz Pentium III SYSTEM is $418, same specs as above.

A far cry from $600, or "over $1000".

Again, it's the times.

I wouldn't mind that kind of graphics, and that kind of text mode,
so long as the character sets are redefinable, and one of which
implements a conventional Commodore graphics character set (which
so many people seem to have memorized).

6080. Re: If you could design a $300 homecomputer today, what would you choose?

Newsgroup: comp.sys.atari.advocacy
Date: 2001-07-16 04:32:48 UTC
From: wbdesnoy@acs5.acs.ucalgary.ca
Message-ID: <9itqpgpoi1@nserve1.acs.ucalgary.ca>
Source record: 1045
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.advocacy, comp.sys.atari.st,comp.sys.cbm,comp.sys.sinclair

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

Software:
- task switching. need not support running
background processes, but I should be able to
access other software while working
- mostly command driven, put pointer is also
available (I'm viewing this from a programming
standpoint. I don't want to waste time
learning an event driven interface, along the
lines of MacOS or Windows, for a "hobby
machine")
- a default command set which resembles the
more common unix utilities
- programming language must support graphical
output, using an easy to learn model (as most
versions of BASIC had, or PostScript)
- a machine language monitor, and an assembler
should be provided by default.

These specifications are purely from the hobbies perspective.
I believe that this is something which I could put to productive
use, yet still learn the workings of (and program) with a decent
level of competence. It should also be easier to document than
the modern batch of PCs and Macs, which everybody appears to be
drooling over.

Who cares about getting with the times. I can't figure out what
to do with a 50MHz box, let alone a 1GHz one (let alone the 350MHz
one I'm on right now).

I would expect something like this to cost between $100 and $200.

Byron.

You couldn't get that much ram on a 68000 because it only has a 24 bit memory bus. You would have to go to a 68030 or so to get the wider data path.

I have to agree.

Let's just limit it to installation. I've installed many versions of Linux over the years. Each one something of a challenge that would floor the average computer user.

OK, I admit that when I installed Mandrake 8.0 on a loaded Pentium III 800 it was a snap. It even recognized my Sound Blaster Live! and a Linksys NIC (Tulip) without any help on my part! But when I tried to install the same distro on a Pentium 100 -- same NIC and a Sound Blaster AWE32, it bombed miserably. I do have Red Hat 7.2 running on that machine, but it was hand-configuring all the way. It would be torture for anyone who was brought up on Windows.

Still, I wouldn't be discouraged about putting it into a $300 computer. Lets assume a high degree of uniformity in the hardware of such beasties. A distro of Linux, or any other OS could be designed to install easily in such a limited hardware environment and probably could be run and maintained just as easily.

I'd also have to say that users of such machines as Atari 8-bits would have the mindset to deal with any problems that came up.

Take care.

Alan

I felt as though I needed to throw in a bit on this subject.

You wouldn't have much choice on the CPU because the older the chip, the harder it is to get. Designing with the latest allows you to get production quantities with manageable lead times so inventory can be kept to a minimum. The older the chip, the more you have to buy at one time to assure you have it when it is in short supply or no longer available.
Also, you have to use larger memory blocks/chips for much the same reason as above. If you can design and build with the most demanded memory, it is cheaper to get but takes longer because of demand. Compare the cost of 256 meg of: PC2400 DDR to PC133 EDO and you'll see what I mean.

Much has been said in this thread about why some one would design or buy such a computer rather than buy an intel type pc(PIII). IMHO, it is more a question of following the group and being a MS slave or trying something new and different. Perhaps even doing so while not filling bill gates pockets with even more money. I'd mention apple but MS has got its fingers in that pie too.

My old Atari (400 w/flat keyboard through an ST) were reasonably stable, fun to use, great learning tool (both for hardware hacking and software) and were ahead of their time(well not the ST<GRIN>)..

I'd gladly trade my Athlon based PC for a good, fast, up to date Atari type computer. But unless it had software that is "compatible" and up to date, it really is a "pipe dream".

I'll step off my soap box. That's for the chance to express my opinion(s)

Then throw in some sort of decoder for the 64-256MB chunk. Since it is not the main memory (that would be the 4MB chunk), it should not make much of a difference. Indeed, it need not make any difference to the average programmer, since it would (presumably) be access through a set of file system calls.

Besides, isn't the 6502 limited to 64kB chunks. Apple simply implemented some sort of paging mechanism to access the 128kB found in later models (IIe/IIc). Likewise for the 192kB card which I have lying around here, somewhere. (Though my understanding is the 1MB card for the 8-bit machines used some sort of window into memory.)

Byron.

Memory Management Unit which really extends the addressing
the processor has. To the programmer, it is as if you had 32 bit
addressing. You set the MMU chip to "bank" of RAM you
want and pass the rest of the address to memory bus. However,
you would then need to develop a MMU and the added cost
of R&D would increase your cost to build. It would be safer
to just move to a 68020 or 68030 processor and bypass the
smaller bus. I would think the chips are not much different
in cost these days as they have been around a long time.

I seem to recall that the Mandrake 8 graphical installer needs something
like 64Mb of RAM and having less is pretty much the only thing that I've
ever seen cause it to bomb out.

And Red Hat sucks big time. Even the latest version.

The way that I differentiate between 'script' and 'compiled' languages is,
roughly, this...

If the compilation (and linking) step is commonly separate (C, C++, Pascal,
Ada...), it's a compiled language.

If the compilation step is integrated into the runtime environment (Perl,
Python (I think)), it's a scripted language.

If the compilation step is omitted altogether (BBC BASIC and purely 8-bit
BASICs), it's an interpreted language.

WHAT?!?! 24 address lines gets you 16 megabytes. He's taking 4-8
The fact is that the Mac Plus had 24 address lines and 4 megs. - and that was
in 1986!

Perhaps I'm oversimplifying things here but, assuming 1MB pages into this secondary memory, wouldn't an 8 bit register attached to a decoder suffice?

As per the 68020 and 68030: it sounds great wrt speed and functionality, but what would be the cost in complexity (for the end user, of course)?

This is, in essence, a machine which I would want the user to be able to pull apart and modify, if they so desire, without a degree in electrical engineering. I have seen people modify the old 8-bitters, and there are people who will modify (for example) the TI-89/92 calculators (which are based on the 68000). I have not encountered people who go to such trouble for i386 or later, or the PowerPC. Just peeking into the processor manuals for those beasts is very intimidating. I can hardly imagine what a complete set of documentation for a modern PC would look like, if such a thing existed.

Byron.

WRONG WRONG WRONG!!!!

Go check the 68000 Data book. For that matter take a course in basic digital electronics. A 24 bit address bus will support up to 16megabytes total with no extra tricky hardware requireed. Btw, the data path is irrelevant to amount of ram a cpu can address, data bus is strictly for moving DATA, wider will give shorter read times for large values. the Address bus determines how much memory is available without resorting to such things as bank switching & so on. Btw, the 64 to 256 megs of flash mentioned could be addressed with some additional hardware. This is not "pie in the sky fantasy", but the common techniques used on apple II, commodore & atari 8bits that supported more than 64k of ram + roms.

An unfortunate design defect of the 80386 is that it can't
execute 6502 code. Maybe if Intel could get its sh* together,
it would design a chip that we here at comp.sys.cbm might
actually be willing to try out.

>If the compilation step is integrated into the runtime environment (Perl,
>Python (I think)), it's a scripted language.

Python can be either, just like emacs Lisp. Of course, it 'compiles'
to a byte-code which it then intreprets, it's not *real* compilation.

Perl also has seperate compile and execute phases, although at present
you have to do truly evil things to presuade it to spit out the
byte-code.

However, I think that that differentiation is bogus. It means that
most implementations of Lisp are not programming languages. It means
that if (god forbid!) you were to run C in an interpreter, it would
not be a programming language.

Dude. He said he wanted 64 meg to 256 meg of RAM. A
68000 with only a 24 bit address can't address larger
memory schemes. 16 meg would be the limit of a 68000.

Apple crippled the memory on the early machines. The later
LC had 10 meg of RAM available although 6 meg was set
aside for ROM. The Mac Plus was even worse. It was limited
to 4 meg because Apple didn't let the Mac support larger than
1 meg simms. It only had 4 simm slots. To go larger it had to
support larger simms like a 4 meg simm. However, on the Mac
Plus/SE, Apple set aside 8 meg of address space for ROM. This
limit was not broached until Apple decided to make 68020 based
machines with larger address space. He is wanting 64 to 256 meg
of static RAM.

You could say the same thing about e.g. Javascript too: it has a full
set of bit-fiddling operations, numeric operations, string operations,
and it's even object oriented. But it's still considered a 'script'
language....

The reason these languages are called 'script' languages is probably
because programs in these languages usually are interpreted rather
than compiled.

"But Basic is interpreted too!!!" I hear you cry. Yes, it used to
be, but that was a long time ago - today it's usually compiled.
However, it is still sometimes interpreted - one such example is
VB-script.

A vendor, however, will be paying for OEM Windows, not retail. The OEM version is usually much cheaper, but with stricter licensing (i.e. must be sold with a computer, can't be installed on another PC, etc.). So, figure US$50-$75 for Windows, maybe even less.

Is this after the new licensing scheme comes into effect?

Oh sure, throw in this non-standard bit of chaff here($), and that non-standard bit of dross there ($$) and pretty soon you find out why things like "Atari clones" cost a small fortune. Some sort of decoder here, and a bank-switcher there, and we're not talking about $300 retail any more.

And how much did that 192k card cost?

And how much would that translate into today's currency?

A 48k RAM expansion board for an Atari 400 retailed for $150, which in todays dollars would break this project before it got started.

Low volume, non-standard, high cost.

It's called "Market Research".

It's part of the process of finding out if there is already something
on the market at the same or lower price point.

If someone is already making something like "The Wonder Widget" and
selling it for half what it would cost YOU to make your version of a
Wonder Widget, it wouldn't make any sense for you to try to sell one,
and it wouldn't make any sense for anyone to finance your business.

If Gigahertz computers still cost $3000, it might make sense to try to
come up with a $300 computer that would do a lot of the same things.

Unfortunately, as some of the messages here have pointed out,
Gigahertz computers now cost as little as $350, making a "New"
computer based around some arcane, non-compatible, possibly obsolete
CPU chip, with no software available, and a user-unfriendly operating
system an awfully "hard sell" in the marketplace.

Companies like Atari, Amiga, Sinclair, (fill in the name of any one of
dozens of others) and even Apple have found out the hard way that just
having a "superior" box won't do any good at all if no one buys it.

The question is, who will buy this new $300 box?

So where on this planet do you live?

Check (as I said a few dozen messages ago) www.pricewatch.com
and find out how little a PIII Gigahertz SYSTEM really costs.

(Here's a hint: $418, INCLUDING Windows OS)

Or go for an Athlon Gigahertz for about $300 (again INCLUDING
Windows.)

A life is at your own discretion.

Ignore it, it'll go away eventually.

It actually DOES have relevance to the Atari 8-bit world, as the
inspiration for designing a new inexpensive system harkens back to the
venerable Atari Home Computers that brought "Power Without The Price"
to the few dozen people who ever bought one.

(and yes, I have an attic full of them myself)

There's a lot of nostalgia for the "simpler times" and the "simpler
machines" which populated them.

I get nostalgic every time I think about spending $550 for a floppy
disk drive.

Unfortunately I doubt anything is ever going to bring those times back
again.

A further "design defect" of the 80386 is that I don't believe they're
being made any more.

But he mentioned 4-8 megs of RAM, which is VERY doable with a 68000, and the 64-256 as battery backedup RAM disk for documents. As RAM disk, the address lines aren't the issue. You can have 1 meg RAM disks with the Apple][+.

You didn't read what he said very carefully:

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

And, in his reply he said:

> Then throw in some sort of decoder for the 64-256MB chunk. Since
> it is not the main memory (that would be the 4MB chunk), it should

> not make much of a difference.
>

So, 4-8 as main memory, easily accessed by a CPU with 24 address lines,
and 64-256 battery backed RAM disk, which has little to do with address
lines.

68000, 80286 (or higher), or 65816 could do what he was thinking, as CPU.

This is true but the other memory is still memory and has to be accessed
in some manner. Plus we are talking about a sub-300 dollar machine
and any custom logic is going to cost money.

> 64-256 as battery backedup RAM disk for documents. As RAM disk, the

Oh really. You still have to get stuff in and out of your RAM disk and it
takes address lines. You will still need an address decoder to be able
to switch banks of RAM in and out of main memory. It doesn't happen
like magic. A real address in memory must somehow find its way
to the correct bank of RAM that you want to access. It is a real
pain in the butt doing it that way. The Apple II couldn't address
more than 64K or RAM at any one time anyway. Programs
never exceeded the size of memory space. The 68K is a totally
different animal. Programs can be huge on a 68k machine. I don't
think you would want to bank switch RAM to run a program.

If you want something all singing all dancing then even if I could design something better than a PC I haven't the time to write all the software to go with it.

If however you want to just make a computer for the satisfaction of saying "I made that" then I would make a clone of an antique home micro. The hardware design would be feasible, and you wouldn't have to write lots of software for it. The hardware could fit in fewer smaller parts than the originals, with modern memory chip sizes.

A few candidates would be:
ZX81 in PLDs or FPGA (done by Ian Bradbury and Bodo Wenzel respectively see http://www.howell1964.freeserve.co.uk/ZX81/ZX81.htm)
Commodore C64 in FPGA (done by Jeri: http://www.geocities.com/cm_easy/ - impressive!)
Acorn Atom / BBC micro / Atari 800XL / Atari ST / TRS80 / Spectrum in FPGA

Why not using 80386, then ? It has it all- MMU and segmented adressing, and one
even gets a several 100's bytes of cache ? ;o)

The older machine has 64 Mb of RAM. Maybe it needed just a trifle more.

But my point was that any OS that's specifically designed or customized to work with a very narrow range of hardware variation could be successful on these supposed $300 machines.

So using javac isn't real compilation either...? I'd say that it's real
compilation, just for a virtual machine.

> Perl also has separate compile and execute phases, although at present you
> have to do truly evil things to presuade it to spit out the byte-code.

:-)

Slight edit needed, I think: "is commonly separate" => "is or can be used as
a separate step"... and yes, I've seen a C interpreter...

I wouldn't be too surprised to see that. -

I just did a little poking around to check on prices of Motorola 68020
and 68030 CPUs, just to see how they would affect the cost of a $300
system.
```

Allied Electronics doesn't even stock them any more, but for only $200 they'll order you a 33Mhz 68020 chip.

That's almost THREE times the cost of a 1Ghz Athlon right now.

(And that's their QUANTITY pricing. Ouch!)

Supply and demand at work.

Really. I have a 1 meg RAM card in my][+. There were a number of such cards sold. And some were battery backed. 16 address lines, 8 bit bus and 20 bit address space. Surely you have seen such in ads. And since that was done with an 8 bit 6502, I'm sure the 16/32 bit 68000 could do it too.

> You still have to get stuff in and out of your RAM disk and it

RAM disks aren't part of your main memory. DUH!! Do you bother to read any of the posts being made? The software that organizes the RAM disk is in your memory, but as far as the CPU is concerned, that chunk of RAM is no different than a hard disk or floppy disk. Or do you wish to assure that disk drives are also part of the CPUs memory, being switched in and out?

Wrong! Programs often exceeded memory space. It was called overlaying. Ever hear of WordStar? And yes, that was a Z-80 program, but 6502 programs did the same thing. The overlays were on disk, called in to replace a part of memory (much like bank shifting, but much, much slower). With a RAM disk, exactly the same thing happened, only the data/code was stored in RAM outside the memory space of the CPU, and organized as a RAM disk.

The Coleco ADAM did this, so did the Atari 130 XE. There were plenty of boards like this for S-100 computers using the Intel 8080 or Zilog Z-80. In fact it was the best way to use CP/M Wordstar. Some would say, the ONLY way to use WordStar.

No one was talking about bank switching.
He was talking about a 64-256meg battery backed RAM disk though.

Bob Retelle (bobr1@provide.net) wrote:
: The question is, who will buy this new $300 box?

Perhaps nobody. We are simply playing with ideas here.

Or, perhaps, somebody. Look at the groups this discussion is taking place in. How many people would even consider using these machines in an era of GHz computers? After all some of these machines run at a poky 1MHz, and are crippled by 8 bit wide words. (My Apple II fits in that category.)

Apparently a large number of us still use those machines. Some of us still buy those machines. Sometimes we pick up the original thing (Apples, Atari's, Commodores, and so forth) for a bargain. Sometimes we pickup devices which have similar, embedded processors. The TI graphing calculators use the Z80 and 68000 processors. These calculators appear to fit in the $80 to $220 Canadian range, and I'm willing to bet that there are good margins.

So maybe there is a market. But that still shouldn't prevent us from discussing ideas.

Byron.

: Allied Electronics doesn't even stock them any more, but for only $200
: they'll order you a 33Mhz 68020 chip.

That price is insane, and I suggest that you shop around more. And focus on the 68000, which I have seen in calculators costing about US$120. I am quite confident that the manufacturer is not producing these at a loss, and likely have a healthy margin. One of these calculators served as my inspiration, only with boosted I/O capabilities, much more open design, and with the OS in ROM where it can not be damaged. (I pulled mine apart, and it used a Motorola 68000.)

I will not argue withthe PB100 hypothesis though, as I am a Mac user.

It is worth noting though that only parts of the Macintosh and IIgs operating systems are in ROM. For the machine to be in a useable form, the rest must be loaded from disk (the Classic was an exception, but even it does not spring to life as an Atari ST would). Indeed certain drivers required to access the original Macintosh hardware do not appear to be in ROM, including part of the serial driver, the print manager, and the AppleTalk manager. (From Inside Macintosh Vol. I.) details are bound to be different for later models, such as the PB100, but I would imagine that (proportionally) less was integrated into later versions of the ROM.

Now why is that relevant? Well, I would want the whole OS in ROM. That way, if you goof up while creating patches, you simply reset the machine (or, better yet, disable patches while booting in order to recover your data). This calc of mine (with the OS in flash memory) has given me a scare a couple of times, and certain parts of its software do not appear to work correctly to this day. It is, of course, poorly documented so that is a problem too. Hopefully the ROM would be socketed, so that the OS could be upgraded (or the patches incorporated in some optimised form).* But that is not a huge issue. The other reason for a ROM based OS is to avoid the lengthly process of reinstalling the OS, as I'm certain many of you Windows users enjoy. ;-) The patches would have to be reinstalled, but your machine wouldn't be in an unusable form without them. If the patch installation system is sensible, they should be quite easy to copy from a floppy disk to a system folder anyway.

Byron.

[*] Come to think of it, wouldn't flash memory have a write enable line? If so, a manual switch or jumper on this line would be a suitable alternative.

> in the butt.

I did say that they would have to be bank switched. It would still
need an address range to move the data to like that extra 64K on
the 80 column IIe card does. It is bank switched. What I meant
in saying they didn't exceed the size of memory was that only
64K could be accessed at one time. To get more memory requires
the programmer to bank switch the program or to swap code
out and pull it from the Floppy/HD in his code. No hardware
or OS automatically handled that on the Apple II. The early
PC's like the 286 had all kinds of odd ball memory due to the
8-bit legacy of the 286 processor. They still had 64K code
segments and any one chunk of code had to reside on a 64K
bank. You don't want to place a loop on two banks of memory
because that would require you to bank switch constantly.

> For software like a RAMdisk, it's not a pain in the butt at all to use
> bank selection. No different from selecting what sector of a disk drive
> to read in a driver for an ordinary electromechanical disk.

While that is true, it requires special coding on the part of the
program. Not all Apple IIe programs supported the extra RAM
and it was the minority that did. The program had to be aware
of the memory. Some smarter 8-bits using the 6809, had a
MTU unit which would take care of the bank switching. They
had a smart operating system called OS-9 that knew how to
handle the memory plus it had a hardware chip which handled
a lot of the memory management.

The other way was using the Chain command in the older
basics which would remove the app in memory and load
the referenced code. Not all Basics had that command. That
made it a bit easier but on the Coco, it required the programmer
to write routines to access the memory. It was not handled

automatically by the OS.

Sometimes one's thoughts and what one types aren't always the same. Perhaps that is why your last sentence is nonsense. Many programs for 64K 8 bit computers were larger than 64K. Some 8 bit machines used bank switching, some used overlays, and some used both (WordPerfect for the 128K ProDOS Apple //e or //c would run MUCH faster if one added extra memory and formatted it as a disk drive, copied the files to the RAM disk and launched the program from the RAM disk. Neither ProDOS nor WordPerfect did any "bankswitching", only the loading of overlays from a disk.

> To get more memory requires
> the programmer to bank switch the program or to swap code

> or OS automatically handled that on the Apple II.

But then, the machine that you protest would cost too much would easily do that. As I recall the 128K Mac used "virtual memory". Was that the ability of the 68000, or the OS, or both? And why couldn't it be done on this machine inexpensively?

> The early
> PC's like the 286

The early PCs, of course, used 8088 and 8086 chips.
The second generation, "Advanced Technology" machines used their 286 and later 386 CPUs as fast 8088/86s.

> had all kinds of odd ball memory due to the

Of course, you have the same situation with the IIgs, because the 65816 has
segmented memory.

No, it doesn't. It only requires RAM disk software. *IF* by special, you mean
the ability to use a RAM disk as opposed to a floppy disk or hard disk.
Again, overlays were VERY common in the late 70's and early 80's. Memory cost
too much, so programers had to use disk space. Besides, you have shifted the
point. You said the problem with his machine was very expensive additional
hardware. Nothing about additional code.

None of the above however deals with the erroneous conclusion that 64-256meg
of RAM disk would require expensive additional hardware to use with a 68000
CPU.

As the matter of fact, thats prolly not exactly true :) International
Space Station team use 386 for onboard computers on ISS :)

Not exactly sure about that. They are used for onboard computers on
International Space Station currently being build :)

Oh, they are. The 80186 is also still rather popular (it pops up
quite a lot in cheap disk controllers and the like, and consumer
appliances - my fridge has one for no reason that I can fathom). Even
the 6502 and Z80 are still being manufactured for use in embedded
systems.

I think I'd rather buy from auction something cool with my US$300,
like a used SGI workstation. So long as Winblows doesn't appear on
the monitor I'll be happy spending that on a used machine...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

In fact, 68000 had three signal lines (FC0, FC1, FC2) which AFAIK could, with some equilibristics, be used to make it address eight 16MB address spaces. I am not saying one should do so (to the contrary) but technically it might be done.

cu.

Bob Retelle <bobr1@provide.net>

: >I'm not subscribing to csa8bit to receive all those info I don't want to
: >read.

: Ignore it, it'll go away eventually.

I surely hope so...

: It actually DOES have relevance to the Atari 8-bit world,

Well, *some* msg's in the thread have a little bit Atari 8-bit related stuff in them. Unfortunately, many of them don't have any at all (notice all the crosspost info). The topic is now more about how much memory you can control with an 68xxx CPU, which has absolutely nothing to do with an 8-bit Atari...

: I get nostalgic every time I think about spending $550 for a floppy
: disk drive.

Time hasn't changed. The 1050 was state of the art in those days. About the same when you go out to buy a good DVD rewriter for the Wintels. Same price, same state of the art, and virtually no value when it's 15 years old. Some people will get nostalgic at the time it hasn't any value anymore, others may still use it, like I use my 1050 drive right now...

I don't get nostalgic when I use my Atari 130XE to program some things or what, or take a look at my BBS. This is cause my systems are used about every day or so. I get more nostalgic when joining an Atari 8-bit meeting, with a room full of 8-bitters that are actually used and not owned by people who keep them just for nostalgic reasons and use another computer to emulate the thing.

I don't say it's wrong to collect for nostalgic reasons or use an emulator. It's just that about every topic is about emulators and .ATR images, about how to convert them, how to format them, or how to build a "better" new computer, how to emulate this, how to emulate that, etc. What's wrong with the original Atari 8-bit hardware? Many people seem to forget there was a thing *before* the emulators, namely a real computer...

Don't get me wrong. I also have Pentiums laying around, and am using A.P.E. to transfer ATR images if I need to, but rather talk about the 8-bit side of the SIO2PC interface in stead of the other end of the cable...

My $0.02

^^^^^^^^^^^^^^^^^^^^
> because the OS dont offer services/drivers I do see a problem using it for a mainstream home OS.
> Do you think linux is not on everyone computer because of marketing only?!?!?

Um, you're using XP... You're whole operating system IS beta.

Anyway, it's the hardware manufacturers job to provide drivers, not the OS. Any hardware worth having works in linux for the most part.

You don't NEED to recompile linux, some people do because they CAN, with linux you have that option. With windows you must upgrade or format and reload to implement new features. I didn't need to recompile linux to support ICS, but I did need a new copy of windows. I didn't need to reload linux to support fat32. but I did need to upgrade to rev-b95 windows. Same goes for USB, with windows you had to replace the whole OS to get that functionality. Firewire, ect, same thing there... you were saying?

And yes, the biggest reason people use windows is marketing, it comes with the computer. XP is nice, I'm using it right now (RC1 2505), but I wouldn't trust it to the extent I trust my Progeny Debian box. Heck I wouldn't even have it if it wern't for this MSDN subscription (another thing MS did right).

The only technical superiority Microsoft Windows has over Linux is the Gaming SDK/DirectX, which is incredibly good. No matter how much someone likes to bash M$, they still have to agree.

Your/My Win XP doesn't support 64bit, so again here comes an upgrade and/or format and reinstall. not on my Linux box! Rumor has it XP doesnt handle 64bit PCI very well either (was looking at that dual athlon board). In learned MS fashion, we "need a newer version"

It was a similar type of hardware in that it was produced in very low
volume and had no "standardized" parts in it, thus the individual
retail price was very high.

(Of course, in those days there really was little that could be called
"standardized", I admit.)

Most of the suggestions proposed here have been great from the "gee
whiz" neato aspect, but I really doubt they could be realized for the
target price, especially considering the overall sales are undoubtedly
going to be very small.

Well, Newark Electronics has the slower 20Mhz version of the 68020 for only about $65 each, but they only have 65 of them in stock.

I checked the 68020 and 68030 because those were suggested in several of the messages discussing Memory Management.

The 68000 requires an external MMU, taking up more real estate on the motherboard and adding cost to the basic cost of the CPU.

Having lived through the "OS in ROM" with the Atari ST, it can be a "double edged sword". It WAS great to have the OS boot almost as

fast as you could blink.

Unfortunately though, if there were any bugs in the code, (HA.. IF)
you were stuck with them until the manufacturer could get around to
first finding them, then fixing them, then finally producing a new
version, then distributing them, then finally you get to open your
machine and manually replace them.

With Atari, that manufacturing cycle took about as long as the useful
life of the computer. It's far more difficult than releasing a
"service pack" on disk.

And, the cost to the end user was ridiculous.

(Of course, it DID generate a nice little "cottage industry" for
programmers to come up with fixes and patches while waiting for the
"official" ROMS to finally appear.)

Do you really want "Mom and Pop" $300 computer buyers to have to be
prying ROMs out of sockets and jamming new ones in?

Actually what I always thought Atari should have done with the ST was
to put the OS on a cartridge. That way they could issue updates which
could be swapped as easily as changing a game, and the old cartridges
could be returned in the same shipping box for a credit. Sort of like
deposit soda bottles.

Only problem is, it would add $$$ to the cost of the original unit.

(Cartridge shells, cartridge pc boards, sockets, bypass capacitors,
possibly buffer chips, EPROMs, socket for the motherboard, tooling for
the computer case, etc.)

When we would suggest improvements in the ST, Atari would whine about
the cost. For example, sockets for the memory would have made RAM
upgrades very simple, but they told us that would add $25 to the
overall cost of the original computer, so sockets were out.

>
>Byron.
>
>[*] Come to think of it, wouldn't flash memory have a write enable line? If
>so, a manual switch or jumper on this line would be a suitable alternative.

Yes, FLASH RAM would be workable, but... you'd also need a boot ROM
with the read/write routines for the FLASH update in it. Otherwise,
one hiccup and your computer's OS could be toast with no way to fix
it. Just like blowing away a motherboard with the wrong BIOS
upgrade. And of course, add the cost of the boot ROM and
interfacing.

Hi all,

As though following this discussion at a computer newsgroup I would like to follow the idea of some others:

What might be the purpose of this $300 machine?
What kind of task does it need to be prepared for?
By what features might it be sold? (What is the difference to existing systems ranging from gaming consoles to standard PC?)

While scanning through all the answers I picked out one topic pointed out several times:
it has to be userfriendly - that thing must be some sort of plug-it-in-and-there-you-go...

I consider that it should be some kind of entertainement-station looking like the typical audio-hifi-stuff. There has to be the possibility to run all kind of media: from CD, DVD, to internet-based-information (including connectivity for VCR, TV, ...).

Concerning the OS I am not sure if something capable of what I am thinking already exist: the GUI must be designed the way that even the unexperienced generation of my parents (~ 60 years) will be able to use it from the beginning: Putting in some media must make the thing behave like the very same machine they are used to. A DVD-movie must change the display to some kind of "VCR"-display with touchscreen-buttons and moveable-regs ...
Or feeding it with a electronic lexicon must change the display ... to some e-book like view, where it is straightforward to turn around "pages" or flipping over to the relevant part of the book.

Saying it short: fit it to the typical living room equipment, close to the TV. Prepare for all kinds of computer periphals and home equipment (coffee-maker, fridge ...). Integrate phone, fax, mail, sms.

To be discussed,
Helge

The address space of the 286 was 24 bit, although those 16 MB of
memory was addressable only in protected mode -- in real mode, the
286 could address 1 MB + 64 KB.

helgetu (h.schaefer@tu-bs.de) wrote:
: What might be the purpose of this $300 machine?

It was originally targeted for computer hobbiests. Given the groups we are posting to, it would share some of the characteristics of the 8 and 16 bit machines of the 80's, or would suit the tastes of the current users of these machines.

I was thinking of something easy enough for an amateur to understand the electronics, and low level programmaming of the device. (My view is that modern machines are too complex and too poorly documented to fit this market.)

: By what features might it be sold? (What is the difference to existing systems
: ranging from gaming consoles to standard PC?)

Any computer would have to be differentiated from current PCs, game consoles, and PDAs in a *significant* way. It would be next to impossible to compete in the present computer/entertaiment industry with a product which the big guys view as viable.

: it has to be userfriendly - that thing must be some sort of
: plug-it-in-and-there-you-go...

User friendly is a very vague notion, because what is obvious for one user, will appear to be counter intuitive to another. Particularly so if you are attempting to differentiate yourself from current products. Also, there are different levels of user friendliness: easy to learn, vs. easy to use; also, I view current systems as being difficult to program (too much so if you are not a professional programmer). Older systems were much better in this respect. As an example: it was easier to put graphics on the screen in the olden days. With the Apple II you simply switched to the appropriate video mode, then drew lines or pixels. There was no windowing system, or complex event manager, to mess with. On modern systems, you need to obtain special tools (such as ghostscript) to create programs incorporating graphics -- in any reasonable manner.

: Concerning the OS I am not sure if something capable of what I am thinking
: already exist: the GUI must be designed the way that even the unexperienced
: generation of my parents (~ 60 years) will be able to use it from the
: beginning:

A nobel idea. It is not the suggested market, but you certainly have ideas worth exploring.

: Saying it short: fit it to the typical living room equipment, close to the TV.
: Prepare for all kinds of computer periphals and home equipment (coffee-maker,
: fridge ...). Integrate phone, fax, mail, sms.

Integrating too much stuff in one device can complicate the life of users.
So, while a fax/mail/phone device may simplify communications, and a DVD/CD
device may simplify entertainment (particularly given the physical similarity
of the media), a DVD/CD/fax/mail/phone device is going to present too many
dissimilar options to the user. IMHO, that is one of the reasons modern
computers are not very easy to use. Better to use the old stuff, where the
computers did computerish things (interactive entertainment, or content
creation).

Byron.

I demand that Bob Retelle may or may not have written...

[snip]
> Having lived through the "OS in ROM" with the Atari ST, it can be a "double
> edged sword". It WAS great to have the OS boot almost as fast as you
> could blink.

That's easily enough done on this Risc PC, should I need to do so. However, it's better to let it run its boot sequence so that disk-based resources can be located and initialised.

> Unfortunately though, if there were any bugs in the code, (HA.. IF) you
> were stuck with them until the manufacturer could get around to first
> finding them, then fixing them, then finally producing a new version, then
> distributing them, then finally you get to open your machine and manually
> replace them.

Or you might be able to load patches or replacement modules or even a whole ROM image. Two of those apply to this machine, and yes, there was a short while before I got hold of RISC OS 4 ROMs when I was softloading a version of the OS...

[snip]
> (Of course, it DID generate a nice little "cottage industry" for
> programmers to come up with fixes and patches while waiting for the
> "official" ROMS to finally appear.)

That happens in the RISC OS market to a small extent. Of course, it helps when the OS supplier can and does release patch archives (or "service packs").

> Do you really want "Mom and Pop" $300 computer buyers to have to be prying
> ROMs out of sockets and jamming new ones in?

Probably not... flash ROM is finding its way into new machines and onto some hardware upgrades; there is a StrongARM processor card which has this.

> Actually what I always thought Atari should have done with the ST was to
> put the OS on a cartridge.

Maybe...

> That way they could issue updates which could be swapped as easily as
> changing a game, and the old cartridges could be returned in the same

> shipping box for a credit. Sort of like deposit soda bottles.

Or you could keep it and sell it on to somebody who hasn't upgraded to *that*
version, never mind the current one. Although that's almost as easy with just
the chips themselves :-)

[snip]
> FLASH RAM would be workable, but...

Flash ROM, surely.

> you'd also need a boot ROM with the read/write routines for the FLASH

True...

> Otherwise, one hiccup and your computer's OS could be toast with no way to
> fix it. Just like blowing away a motherboard with the wrong BIOS upgrade.
> And of course, add the cost of the boot ROM and interfacing.

Not to mention if you have your mass storage on a third-party interface card
which has its own on-board firmware, which the OS will softload or access
directly and which is probably itself in flash ROM... although in this case,
a floppy with the firmware and, optionally, a flash programmer for that card
would do.

How about Transmeta's Crusoe? This would outsell everything mentioned thus far I guarantee it. It can emulate anything, including x86 at native speed!

Can you imagine UAE ported to Crusoe as its code-morphing layer? incredible.

Modules could be made for just about ANY old school CPU/platform, and an OS wouldn't need to be developed for it, as it could run these platforms OS's natively, maybe even in addition to a custom OS.

Marketing would be a piece of cake, as you could use it from anything from a Kiosk to a webserver, an Amiga emulator to a Unix portable. Webpad's, PDA replacements, hardware controllers, you name it, this thing would be /versatile/!

And the best part is it's /current technology/. Face it, if it can't run Half-Life or get 200fps in Quake, your only buyers will be the people currently reading this thread. :)

Linux Geeks would love it! (if only because Linus works for transmeta). Slashdot would pimp the hell out of it, you wouldn't even need to market it :)

Hell, I'd buy one and just run it as my mail/webserver and
router/firewall. transmeta already has a custom linux distribution
available for it. Not only that, but it could be offered in several
packages, you want WinXP on it? No problem!

The market could even be expanded to commercial vendors, it would be a
viable replacement for say, the hardware TiVo uses now. Cable
descramblers, Sattelite receivers, hell, I can think of very little
you couldn't make this thing do.

R&D required? very little, the hardware is ALL standard, and already
made, produced, and sold, not to mention it already has HUGE "geek
mindshare."

I dont think thats true. The transmeta chip only deliver a fraction of the performance
of a core like the thunderbird at the same mhz.
And you can go in a shop and buy a single chip for under 90$ (the 1.2 gigahertz part).
But then you can get a 750mhz similare core (Duron) for 25$... thats your price.
I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver
46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

>

Their is already so many core running on the x86... From the most obscure to
C64 & amigas.

X86 would be a better choice at all level... Unless this is for a PDA form factor.

Computer do alot nowdays in term of multimedia because of the power they have.
I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

Why would you want to pay for low performance?
Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emulation.

>

You would need native code to do software encoding on that chipat a decent speed.
Who would write all that code?

>
> R&D required? very little, the hardware is ALL standard, and already

Cant that be said for the x86 platform?

Stephan

That's interesting- the MMU in my Atari ST (68000) was one of the
fairly easy "hack" points where you could physically attach memory
expansion cards, since all the address lines were available.

I don't know if Atari used an "off the shelf" Motorola part though.

The reason the ST was limited to 4Mb of RAM was that the MMU only had
enough address lines for a max of 4Mb.

(Atari folks loved to poke fun at PC folks and their "640K" limit-
right up until they tried to put more than 4Mb in their STs. Same
situation- the company "knows best".)

Ahhhh, so that's why with DR-DOS 6.0 or MS-DOS 6.0 you could load DOS
high!!
I didn't know about the extra 64K (rather, I didn't know how you could use
64K of the remaining 15 megs of protected mode.)

Credentials for what? I need credentials? In your dreams! Since when do I have to prove anything to you, of all people? I've been using Atari products since before you were born - credentials enough for you? A-ONE is a hobby - I do it, as does my "staff", because I enjoy it. As long as there are interested people, I'll continue. You don't like the content and format - noted. Your opinions mean nothing to me, for many reasons.

Well it is!
It could power a nuclear powerstation!
It must be true. It was in the adverts.
:)

Then you need to design a 300$ box that kick ass compared to a 300$ PC, otherwise you lost before you even started pouring $ in R&D.

Make sense?

My best hope is Nforce/Duron for sub 500$ systems of really high design standing.

I think if the design can fit in a 6x3x1 inch format with a color LCD a few people would buy them. (Me included)
My casio PB1000 died, and I'm reduce to my 1liner PB100 .. a pocket 'amiga 500' would be a nice replacement.

Would the computers come with a news-reader that prohibited top-posting,
too?

Urgh!

What does it say? I am guessing "(C) Microsoft Corp."

Would that be the BASIC ROM chip? I am quite sure Micro$oft wrote the BASIC
for it (and the Amiga, and probably the VIC-20).

Paul.

I just got a PDP-11. Those machines really *were* used for
controlling nuclear reactors. Amongst other things. Mine, however,
never did anything more glamourous than routing parcels for a
nationwide courier service.

Couldn't you just post it, there's not likely to be many peop's with access
to that hardware.

Can you fellows on the east side of the Atlantic help me with an early 80s question?
When I was in grad school in Mississippi, I saw on the Public TV channel (several times) two BBC series on micro computers.

One was called (I think) The Computer Program, and the other was (as I recall) Making the Most of the Micro.

Each was 12-13 episodes long.

I've tried here, through contacts with the Nebraska Public TV to see if anyone has copies, or where I could buy copies. Do any of you know anything about getting old BBC programs on tape?

Both series had the same host (a Scottish surname as I recall) and covered a number of different machine, but esp the one I don't have and would really like to have: the Acorn BBC computer.

Thanks

Roy

Ian McNaught Davies... With Chris Serl as his clueless "what's a computer"
type sidekick on the computer programme...

Alas. No. Can't gove you any pointers on getting copies. I don't know if the
BBC even still have copies of it.

You could always enquire to the BBC itself.

Here's another one: use a newsreader that uses a decent maximum
line-length, but you don't give a hoot for good netiquette, do you?
All you want to do is troll.

tin has versions for Amiga and Win32, but the former is a bit old and
the latter needs cygwin. Besides, tin is too un-Windows-like for
Stephan to use. He prefers to inflict Outlook Distress on everyone.
The worse it posts the happier he is. He'll be posting in HTML soon.

I haven't tried compiling a new version of tin under AmigaOS. It
might be interesting to try...

slrn 0.9.7.1 was fun!

>;)
>
>It will even insult you, so no-one in the group has to. :)

He's a troll. He's not happy unless someone insults him. Why do you
think he comes here? :)

> But then you can get a 750mhz similare core (Duron) for 25$... thats your price.

A notebook CPU costs more than that, heck I can't even find a price for
comparison. You just couldn't use one of those furnaces in a book-size
unit.

> I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

But it would be a HELL of a lot faster than the 68000/Timex
Sinclair/6502 relics others are suggesting, and it runs without a
heatsink. You ever felt the CPU in a notebook? imagine the temp a

thunderbird would be!

> just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver
> 46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Thats under the x86 codemorphing layer with the optimizations set to
"don't cache code", The Crusoe is a tricky beast to benchmark,
especially against it's own codemorphing layer. The codemorphing tends
to cache the benchmark loops giving unrealistically high scores, so for
simplicity, it's turned off.

> > Can you imagine UAE ported to Crusoe as its code-morphing layer?
> > incredible.
>
> No so sure about that...

It would be wild, a codemorphing layer that abstracts a 68040, and the
chipset! come to think of it, I wonder if UAE would even be needed?

> > Modules could be made for just about ANY old school CPU/platform, and an
> > OS wouldn't need to be developed for it, as it could run these platforms
> > OS's natively, maybe even in addition to a custom OS.
>
> Their is already so many core running on the x86... From the most obscure to
> C64 & amigas.

But those are "emulators", Crusoe's codemorphing is a much different
beast, even x86 is just "codemorphed". c64/Amiga's are running on top of
Windows/linux on top of x86. The Crusoe wouldn't need a host OS.

> > Marketing would be a piece of cake, as you could use it from anything
> > from a Kiosk to a webserver, an Amiga emulator to a Unix portable.

And it looks like they beat me to it, it's now available, albeit at a
higher price, running linux 2.4.5 w/Netscape 4.7 (shudder)

> > Computer do alot nowdays in term of multimedia because of the power they have.
> > I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

On the contrary, they'll market them for dumber things, like Intel
saying it's "New Pentium 4 processor will enhance the web" and going
on about how the internet will be faster. I always get a kick out of
that :)

> > Linux Geeks would love it! (if only because Linus works for transmeta).

> Why would you want to pay for low performance?
> Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emu

Because emulation would /be/ low performance, the Crusoe running a
platform under codemorphing is faster than any emulator I've ever seen.
Show me an x86 emulator that can run Windows faster than the Crusoe can
under codemorphing/x86. Remember, this is a hobby box, if I want to toy
with an OS, I want to run it natively, (or a codemorphing facimile
thereof.)

Plus it's upgradeable (the codemorphing), meaning the platforms it can
morph will increase over time.

> > The market could even be expanded to commercial vendors, it would be a

> > you couldn't make this thing do.

> You would need native code to do software encoding on that chipat a decent speed.
> Who would write all that code?

In the case of the Tivo, it's already been written. the Linux/x86
package is already available customised for the Crusoe, tailored by
Linus Torvalds himself. In the case of the Satelite reciever, you can
find the GPL'ed code from a link off of www.satmatrix.com. Kiosk
software has already been made available for the Crusoe under GPL, so
has PDA codemorphing for the Palm platform.

The beauty is, if code isn't available, as long as you can produce the
codemorphing layer, you just reuse your existing code! Case in point,
Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
x86, it simply pretends to be through abstraction via the codemorphing.
Hence Windows can run "natively" on a CPU it isn't written for.

> > R&D required? very little, the hardware is ALL standard, and already
> > made, produced, and sold, not to mention it already has HUGE "geek
> > mindshare."

> Cant that be said for the x86 platform?

Only for the case of x86 hardware meant to run x86 software, the Crusoe
isn't limited to x86.

As for the "Geek Mindshare" I think a Crusoe captures more mindshare
among the HW geeks than x86 does.

And the Ohio Scientific systems, and the Apple II and, and, and...

Actually the OSI BASIC was an excellent little interpreter. With only
6 digit floating point precision it was extremely FAST (who cares
about .000001 accuracy- I was just writing video games), it was
easily extensible and it only had a few bugs.

Those were the "good old days" when Microsoft was your friend.

Actually the 750mhz part should run 'cool', also you can run it at 400mhz and remove on chip active cooling?.
I put 533mhz celeron in booksize computer and they where fine. a 750mhz duron would be

cake.

Yes, I would choose a rusoe over a 68000, no problem here.
For low power... I kind of like the strongarm.
I dont really have a sweet spot for transmeta effort, I dont see where it really fit in the
market.
I also see that they are not doing well at all... Could be riding the economic wave, or
just problem
grabing some of the cpu market.

>

In the end , MMX/SSE/multimedia/3d stuff will probably run many fold faster on a slower mhz
p3
then a crusoe chip.

At this point I would guess that a mobile p3 can render more then a crusoe using the same
amount of
power... Using less power ut performing less is not always an advantage.

Their is a diference betwen reformating code (UAE is already doing its own type
'codemorphing')
and doing cycle precisise timing on virtual register set of custom HW on top of that.
Their is alot more stuff in UAE then what transmeta is doing, thats why I never caught on
the hype.

Does codemorphing support handling of strobe registers? I dont think transmeta
support emulation of something as complex as the OCS HW register set.
The floppy controler register would need 'HW logic' emulated... etc... Not an easy task.
So you would need to show big revenue to spend all that R&D to emulate decade old HW.

> > > Computer do alot nowdays in term of multimedia because of the power they have.

It run flash smoother, it handle better codec like mpeg4 and real, complex web page scrool
smother, it will give higher frame rate in complex java gfx applets, etc, etc...
So in effect, yes the web to an end user look smoother/faster... He can navigate a bit
faster,
scroll complex page with ease.
Use a DSL conection on a pentium clasic and then a pentium4. If you visite media rich web
page you will see a Dramatic diference.

So I can see people getting a new computer when they get braodband.

What OS worth anything doesn't run native on a x86? :)
And how much power do you need to get z80, 6502, 68000, etc.. emulation going on
a gigahertz clas thunderbird?

>
> Plus it's upgradeable (the codemorphing), meaning the platforms it can

I dont think they have yet to emulate a pentium MMX, they just emulate the basic 486?

What codec did Linus code nativly for the crusoe?!!?!?
Do you have a link on what is in a Tivo box?

>
> The beauty is, if code isn't available, as long as you can produce the

Thats the whole problem... The chip is just to slow.

> Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
> x86, it simply pretends to be through abstraction via the codemorphing.

Like UAE convert 680x0 to x86. I can take a fresh copy of Amiga OS from a box and
install it on a PC.
The thing is windows will expect some kind of common PC chipset/bios support if
its to ru nout of the box... I dont see the point. Get a mobile P3 to run windows, it
will be faster. Support native MMX/SSE at full speed.

Aside hacking a new processor, or fiddle around... why would anyone actually
morph to something else then a x86?
For example, can the sony laptop also run MaxOSX with a PPC version of the crusoe code
morphing?

>
> As for the "Geek Mindshare" I think a Crusoe captures more mindshare
> among the HW geeks than x86 does.

I'm a programming geek.. and I got loads of tools for the x86. I also love processing
power.
The crusoe is a just a processor that got its core designed to be emulator friendly... But
aside
emulation is doen't have much to it.

Again, I'm not a fan of that chip because I see no use for it in all common computing form.
PDA, laptop, bookside, desktop, workstation, server... All have better processor already
there for
the picking.

Stephan

Real newsreaders even let you change the line length as you type.

Well, I guess that should actually be, "real OSs," since the key to
that is being able to change prefs on the fly while you use programs.

Multitasking: try to imagine it.

I may be late to the thread, but anyway...

I don't think that people will be willing to pay $300 for an appliance (as such a computer would be). You have to look at what the current market wants. There are a million and one Internet boxes (the Bush Internet TV is one at ï¿½79, or about $100) that do Internet, email, etc. Not much use for writing a letter or playing games though.

Assuming that you have been given a Government contract to make sub $300 boxes for poor people to enable the Internet revolution and increase education,etc (a realistic modern aim?) then what would you want?

Integration is the name of the game. So is simplicity. It won't have a DVD drive, but it will have a CD drive. It won't have a 40GB HD, but it might have end of line never-sold 5~10GB HDs. It will have built-in modem and ethernet. It will have built-in graphics and audio. It must display to a TV, but a monitor is an option. Expansion ports kept to a minimum (4 USB, no serial, parallel, etc). Internal expansion not necessary. CPU power needs to be adequate, not good.

If you are building 1m boxes, you would sign a contract with Asus/ABit/etc to get low end motherboards with the features that you want only, in the form factor that you want. Use a cheap processor (in quantity, the Via C3 would be good - I bet you could get 600MHz C3 processors in quantity for ~$25 each). Integrated motherboard would be $40 with a $15 chipset (SiS630) and minimal components. Hard drive would be ~$50. CD ~$20. No floppy.

Motherboard (+modem, network, audio, graphics): $40
Processor: $25
Hard Drive: $50
CD: $20
Case (custom): $20
Keyboard: $5
Mouse: $5

As for the operating system - a free one would make sense, however a simple for dummies interface should be employed. The Linux kernel

could be used, with a graphical interface that lets the user run applications and set up the device, but isn't a scary UI. Big icons on the screen, one for each application. Basically the Palm launcher I reckon. Modified applications could be used that didn't prompt the user about where to save the document, but just saved it safely, and when you wanted to open a document, it would just show the user the list of documents that they had previously created. Disable downloads from the Internet except from the device makers, where new apps can be downloaded only (use a special tool, perhaps).

On the other hand, just use a Pace Digital TV set-top box, with built-in PowerVR technology (a la Dreamcast). As non-digital TV will be eradicated in about 6 years anyway, why not lever a device that everyone will need in their house at one point or another?

Graham

> I, not a company or else, can by a 700mhz AMD processor for 24$.
> That doesn't seem 'far too expensive' to me. Those processor rocks!

I would also say that this was a great processor for a device.

> > As OS? (Linux is a dead giveaway, but there also other OS's out there)
> Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

Linux is a kernel. The "Gnome OS" and the "KDE OS" are not
userfriendly enough! Get the Linux Kernel (or FreeBSD kernel, etc),
get QT embedded or GTK/Framebuffer, and create a custom, Palm UI like,
interface that is simple to use.

> > Amount of memory? (RAM and ROM)
> 256meg RAM. 8K EPROM

128Meg will be enough - $9 in bulk apparently. EPROM?

> > Graphic and Sound?
> Geforce2

Waaaay too expensive for a $300 device, unless you were going to sell
it for a $200 loss (XBox).

> > Network capabilities? (internet capable)
> 100BT

Part of most integrated chipsets anyway.

> > Plug in capabilities (remember you're making it as cheap as possible so
> > modems, CD-Roms, HD's are all extras)
> CDRW

Not for a $300 device. Depending on the market for the device, either
a DVD drive or a CD-ROM.

> Take a look at the XBox.

$500 of hardware sold at a $200 loss. With out-of-date processors
donated for free by Intel. The chipset alone would cost $120+ (if a
GeForce 2 MX enabled chipset sells for $90 [nForce], then a GeForce3.5
enabled chipset will cost at least $30 more - more like $50 more).
Motherboard is CPU, Northbridge, Southbridge, 4 USB ports, Ethernet,
Modem, and IDE channel - very cut down to reduce costs.

Graham

It exists already (although the Dimm version is still expensive,
but the Simm version is $300!)

"decades"? Slightly optimistic perhaps. Look back a decade. Find a
good software base. Is this still a good software base? No? I rest
my case.

> ROM is nice, but restrictive. Atari was hobbled by the difficulty of

Dodgy OS. If it was better designed, it would be able to have been
patched in software after the boot process. (see Setpatch)

If it was used at 3-Mile Island in March 1979 it would be a star!
Or at least notorious. There's nothing like having the morning
traffic report contain a reference to a nuclear catastrophe.
That'll wake you up.

The problem is it's a niche market, albeit an expanding one. They don't
even plan to break even for 5 years. I don't ever see them taking over
any desktop market, however, for low-power applications with platform
legacy requirements, you can't beat em.

> > > just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver

Oh, yea, no question about it, but then, this isn't a desktop machine
we're talking about. x86 on the desktop is king.

> At this point I would guess that a mobile p3 can render more then a crusoe using the same amount of
> power... Using less power ut performing less is not always an advantage.

Not on a desktop or server machine, but then thats not where any sane
person would dream of sticking one of these anyway. The goal is a
slightly higher platform abstraction, and slightly lower power

consumption.

Not any more than it took them to write the codemorphing abstraction for
x86, from what I hear, the x86 architecture was a real bitch with all
the registers they had to emulate, I think the reason they emulate a 486
is because those registers were documented. That was the reason NASA
gave for using the 486 as well, access to documentation. Transmeta then
had to provide a BIOS as well, as part of the morph abstraction.

A big part of the R&D has already been worked out by others already, I'm
sure AROS/UAE technology could be used. I know UAE is free under the GNU
GPL license, not sure about AROS.

Sure, but what they said was that the SIMD instructions new to the P3
would speed up DSP code, making software modems faster. I think alot of
people somehow thought that they could upgrade their dial-up connection
by upgrading their processor. ;) It's true the SIMD instructions do
include DSP specific instructions, but I doubt anyone would notice on a
dial-up software modem anyway, and I don't think the network card
drivers will benefit from SIMD at all, since there's no DSP taking place
anyway.

;) If it's meant to run Windows/Linux/Solaris ect. and sit on my desk,
give me my Athlon 1400/266 768MB DDR MSI-K7T-Master w/raid box anyday,
but this is a smaller, possibly battery-only portable hobby thing here
meant to be multi purpose webpad/PDA/portable what have you, it would
have to be very flexible in what you could do with it and where you

could bring it, so as not to become so "niche" that noone buys it.

The reason I see Crusoe as a good match for a project like this is that
it sort of combines a dozen or so pre-existing niche markets into one
market that could be sold the same hardware. There's already a market
for a low-power webpad, and people are willing to pay $2300 for them
(check out Slashdot's submissions for saturday) there's already a market
for PDA's, and Crusoe is faster than anything in most PDA's right now.
portable units for inventory and UPS/shipping are already being sold,
for anywhere between $400-$1000.

Hell, Transmeta's Crusoe, running at 633MHz, is already being used in
very-low power servers, running on 7 watts (idle) to 15 watts (max load)
http://www.transmeta.com/everywhere/products/servers/rlxtechnologies/rlxtechnologies_syste
m324.html

(this link may wrap, my newsreader sucks)

> Do you have a link on what is in a Tivo box?

http://www.tivo.com/linux/index.html

They released their power-PC linux mods as per the GPL.
Since the mods were developed by TiVo themselves, they already have the
codec source, all they would need to do is recompile for Linus's
"Transmeta distrobution" (maybe not even).

If Transmeta releases a PowerPC codemorphing layer (or someone makes
one) they wont even need to do that. This would probably interest TiVo
greatly, as they already stated they wish to make their money from

selling the subscription, not the hardware.

> > The beauty is, if code isn't available, as long as you can produce the

yes for a desktop, but for the applications and the specs of this
project, it far exceeds what the alternatives can do, and will still be
in the "desktop speed ballpark", unlike a z80/68000 ;)

> > Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't

You mean you can install windows, install UAE, install AmigaOS, if you
were buying something specifically to do things like run AmigaOS, why
would you fudge around with windows? Heck, the best way to have a
desktop Amiga is to get an Amiga desktop anyway ;)

> The thing is windows will expect some kind of common PC chipset/bios support if

morphing?

The Sony laptop was made as an x86 laptop, this project isn't about
making a Windows98 laptop, they exist already.

> PDA, laptop, bookside, desktop, workstation, server... All have better processor already there for
> the picking.

The project needs something that can do them all, at whim. No general purpose device will ever outperform a specifically desined for a purpose device, thats why we use 1400MHz Athlons to play games and 33MHz Dragonballs to sync our palms. but neither one of those would be very good at both ;)

You can play Quake on a Crusoe, and still remain at only 2 watts. The same beast will run linux, and can scale down to less and be walked around like a PDA.

It's not something that would replace the desktop, but an extension of it, replacing possibly our webpads, mp3/Rio's, PDA's, pagers, inventory interface units, ect with a common device/platform. It might even slightly eat into the laptop market as alot of people only "need" a laptop for trivial things anyway.

This is now, OEM windows in 5 packs can be gotten from Ingram Micro for
about $80, and Ingram is one of those vendors thats usually more
expensive, but they have everything.

We used to be able to sell OEM Windows with just a Mobo or HDD, but now
they require a full booting machine (or parts that could make one)

The x86 is nasty that way... its *backward* compatible that to make something 100%
x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

I'm not sure their is a market... but if their was, AMD could also make their processor
emulator friendly by adding so facilities to it.?

I dont think you will see benefit at that level (packet thruput). Maybe a tiny, tiny bit by using the cache control insruction. But nothing to advertize about.
The web is vague enought that intel can be doing this compain in reference to the execution of the web data received.

If it will run on batery forget what I said.... I'm intetrested in the strongarm, possibly crusoe native?
The second part here is compiler technologie.

I use to have a PB1000, a programable 'calculator'. Nothing like a TI... it was really like a small 8bit
computer... But it died. and if I could find a <300$ replacemtn I would jump on it.

>

How about the StrongArm? isn't it lower power and pack a nice punch?
For those device you dont really need code morphing unless you dont have the
right compiler tools.

>

> (this link may wrap, my newsreader sucks)

That look massive! I really didn't think anyone would use that processor for server level
design.
Nobody would put that much $$$ in R&D without having studyed the market well...
humm. I must be missing something.

My original comment was about stuff outside the OS. For example software video codec.
You need those to run native to get realtime, usually assemby codec. So you need to man

power to get an mpeg2 decoder (encoder)...

>
> If Transmeta releases a PowerPC codemorphing layer (or someone makes

I would imagine the best for them would be to reuse common PC parts?
Maybe a basic microATX MB modifyed a bit with a custom bios?

>
> > > The beauty is, if code isn't available, as long as you can produce the

I would imagine that someone could build a 68000 today that consume very little
power and runned at high mhz?

How about the .9 volt .5 watt Mobile pentium3?
Or the ultra low voltage mobile celeron (with mmx/sse)?

The 600mhz part is not cheap, but its still under 150$.

>

I think its going to be very, very hard for transmeta to take this place.
But not impossible. If they can impose themself as the standart, then they can live those 5 years to get profitable.?

> Modem, and IDE channel - very cut down to reduce costs.

The xbox cannot cost 500$ for MS to build... the lose probably include all the QA, R&D it took.
They probably spend <300$ to build the xbox... its cheap stuff when you build them in the millions.

You can find some decent complete motherboard retail single unit for <70$ (Thats with audio, 32meg video, the works)
in a retail package etc.. Those probably cost 40$ to build. (Its not geforce2 based, but a Savage4 core.)

The nForce chipset in a year might cost <50$, and people will build <100$ MB using it... Anyway, I'm planning
on building a <500$ PC using this chipset when it comes out. So I'm sure a big manufacturer can build a PC
for 300$ mass produced.

Tech TV had a segment on midi software solutions on PC/Mac hardware and dissed the Atari cutting edge solution which was not mentioned. It is common knowlege that 1990 era Atari midi solutions has revolutionized music composition and has no peers compared to the half bake attempt Apple II, Atari 4-8 bit and older 1987 Mac solutions.

Oh well, Tech TV is not perfect considering that folks who could not make the MacWorld Keynote had to sit through a somewhat flawed live broadcast with stupid commentary according to comments posted on the web. Oh well..

sinclap!

In article <tlpsk6fkn0qj16@corp.supernews.com>, tthai@mindspring.com
says...

> The x86 is nasty that way... its *backward* compatible that to make something 100%
> x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

Heck, even Intel had a hell of a time with the transition from 486 to
pentium(p54c/p55c-mmx), they said there were something like 14 debugging
registers that were "left out" and caused a few problems, some quazi-ops
were dropped, and they had to abort those plans to support those
486"upgradeable" boards with the extra pins that were pentium ready.
(a small price to pay for feature-creep though)

At least the x86 legacy stuff does have an end in sight though, the
64bit CPU's won't be encumbered the way x86 was.

> I'm not sure their is a market... but if their was, AMD could also make their processor
> emulator friendly by adding so facilities to it.?

They could I suppose, but being the Athlon would do the abstraction at a
higher level, I don't know how much more effective it would be. (In a
desktop where you have watts to burn however, its a different story)

> If it will run on batery forget what I said.... I'm intetrested in the
> strongarm, possibly crusoe native?

I miss the simplicity of the 8-bits, I held on to my Vic-20 for years
using it as a hardware controller for EPROM burners and whatnot. One
side of the room I burned them, and the other had UV lights to erase
them (remember those?;) My neighbors must have thought I was growing
pot.
What was so magical about our first 8bit computers that made virtually
everyone who owned them learn to program them, as opposed to today,
where people are so cynical about their machines? We used to "Love" our
computers in a way that won't happen again, it seems. Gosh, did I say
that? I sound like an old fart ;)

I'm totally in the dark when it comes to the StrongArm, I know it's made
by IBM and I hear they have a loyal following in Europe. That about sums
it up as for my knowledge there ;)

Actually I'm not sure if Tivo uses software or hardware mpeg, but
between Tivo and Transmeta, I'm sure they could whip something up.

Or even a retrofitted Sony laptop motherboard maybe (gawd I hate laptop
hardware though ;) microATX would be good, with video/sound onboard,
maybe using laptop IDE hard disks, External 'wallwort' powersupply,
internal battery.

I'm not sure how much power the P3 system as a whole uses yet, havent
had a chance to play with one yet, I'll have to look.

They've got one thing going for them, noone else is after this market, it's currently dominated by hundreds of 'submarket' solutions, Palm, Rio, etc, and Transmeta doesn't even necessarily need to compete with them to controll this market, they just need to become the main vendor for the tribes currently camping there.

Then again, Intel might just decide to squash them.

It's a worldwide conspiracy to intentionally ignore every accomplishment
Atari ever made. They don't want to admit that a game company had so many
innovations first. They know about it, they just don't mention it on
purpose.

Umm... you're using the wrong end of the telescope.

A decade ago there were several choices of competing Operating
Systems.

Now for all intents and purposes there is only one.

(MacOS is a far distant second.)

With the kind of momentum behind the current OS, it's unlikely that
any other OS will be able to overtake the existing software base for a
long, long time, if ever.

Go to the local CompUSA and check out how much shelf space is devoted
to native Linux apps.

I rest my case.

The simple answer is that there was nothing else available and very
little was available for what WAS available.

There was nothing that would run a competent word processor or
spreadsheet, or play a photorealistic game, or render in 16 million
colors, or typeset a page layout, or sort and relate a million entry
database.

If you wanted something other than what you could buy from the back of
Compute's Gazette, you had to learn to program and write it yourself.

There weren't stores like CompUSA where you could just buy the program
and get on with whatever it was you wanted to do.

You HAD to figure out how to POKE graphics to the screen, or VARPRT to
find out where your string variables were stored.

When I bought my first computer (an even older fart), an OSI C1P, I
wanted to play games on it. I bought game programs and ended up
HAVING to learn to program to fix the bugs in the "commercial"
programs. I had to learn the "guts" of the computer to figure out
how to add sound to the games since the manufacturer had designed
sound into the system but not implemented it.

Sure it was fun, and sure I learned a lot, and actually made some
money with it, and yes indeed, I wouldn't have missed it for anything.

But it wasn't what I'd originally wanted to DO with "a computer".

Now, you don't need a soldering iron or disassembler to do what you
want a computer to DO. In most cases, you just get the software and
DO it.

Not everyone wanted to "tinker" with a computer. Computers didn't really "take off" until they became capable enough that you DIDN'T have to tinker with them to get them to do something.

That doesn't help the "tinkerers" very much, I know, but that's the main reason things are different today than they were when 8-bit computers were the only thing available.

That's actually what the original intent of this huge message thread was, to provide a "new" version of the machines we used to tinker with.

Sorry, but what has that got to do with ATARI? This is an ATARI Newsgroup
and any other subject SHOULD NOT be discussed here.

If you've crossposted your message over one or more other newgroups then
this SHOULD ALSO NOT be done, because THIS WASTES BANDWIDTH for everyone
else.

Sorry but it's about time that someone took a stand on this.

Cheers!

James

Kind of... motorola rate their Coldfire 90mhz to consume .95watt. That seem alot compared to
mobile pentium3 running at 10x the mhz. I dont think their is any >200mhz Coldfire...

Lol ;) We had this same war almost exactly 1 year ago! It's similar to
Goddards Law! (Godwin?) First, someone will point out the origins of
specific technological advances, then we'll rebut with 'but he was
/born/ in country /y/ so /x/ doesn't get the credit!'

Then someone will say Americans are all fat and eat at McDonalds, then
someone will rebut with Europeans have teeth that look like dice.

You know it's going to happen, the bloods in the water, the sharks will
come. :)

Sigh... the software base for the existing Operating System is the
point.

The point is that the Operating System a decade from now will likely
be the same, or a derivation of the current Operating System, so the
software base a decade from now will likely be the same software base
as it is now, with incremental changes, not radical shifts in support
for "other" Operating Systems.

SNL had one of their best commercial spoof featuring Mike Meyer doing an
add for a British touthpast made from real sugar...
At one point he said: "You dont need to brush your teeth every week, but you might just
want to"

Or something in those lines.

Off topic? oh well...

<snicker> When bitchin' about ones grammer, you should spell check your reply. :-)

in the term "outa theyre arse" how come you didn't point out the other two words? "out of their ass" , happy? :-) Actually though the spell checker came up and I apathetically just kept clicking change. (a likely story :)

That would just suck. (not that I'm a huge fan of Microsoft)

How will we ever find out if we can make an OS that's better than
Windows if the government steps in?

I think this should be handled differently. Did Microsoft illegally
kill DR-Dos? the court thinks so? ok, then award damages, move on.

Did they kill Netscape, the court thinks so? award damages.

are they crippling Kerberos? the court thinks so? make them open the
documentation to the proprietary extensions, move on.

Can the US government keep M$ from selling XP overseas? now that would
be interesting if M$ just said, "OK", and then kept selling 2k to the US
and XP to the rest of the world.

The only thing worse than Microsoft dictating what software we have
available to use, is the government doing it.

This hurts the Linux crowd too, if you think about it. We're working our
asses off to get the government to understand that source code is a form
of speech protected by the first ammendment, hoping to overturn the
DMCA, and this just works against it.

There are alternatives to Microsoft, Microsoft is not a monopoly,
everyone just uses windows, there's a slight difference. We could use
linux couldn't we? What about the Mac?

It's not Microsoft's fault everyone isn't using something else instead,
so far Windows has no competition only because noone is competing. There
are alternatives, and they're developing. let the market work it out for
itself. Maybe Linux will catch up and bury Microsoft. I'd rather see
this happen than see XP banned, or Microsoft split up.

What would the government do to Linux if Linux had "embraced and extended" or anything else Microsoft has done? I wonder. Could they do anything, even?

Because outa is slang? And Arse is the correct spelling?
An ass is a beast of burden, not an anatomical feature.

Congratulations! That is, without a doubt, the best argument in this entire thread.

May the software companies be free to do what they do best. Develop and publish software. And the government free to do what it does best, tax the taxpayers.

Gee, I hope I don't get on the FBI's "watch" list for posting this!

Linux COUDN'T embrace and extend... Embrace and extend involves not only adopting and corrupting an accepted standard... It means keeping the additions and changes to that standard secret. (Or refusing to allow it's use elsewhere). Kerberos is the perfect example.

They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

Windows 3 could run software written for Windows 2 and probably even
Windows 1, not to mention all the DOS apps available at the time.

Yes, but it wasn't the best software base available, which was *my*
point.

Actually it's because they don't own Amiga any more. If they had released an Amiga under the Gateway name, then what you ay is probably true. However, if they had released one under the Amiga name it wouldn't have mattered. Anyway, this is all ancient history now.

Perhaps I'm out of date, but I seem to recall Gateway creating a a subsidiary
wholly owned, that was to create and sell Amiga/DOS hard/software.

5$ for the printer and 30$ for the cardrige? :)
You can get decent usb inkjet printers for <80$.
If someone cant spent 40$ on a printer, and can only afford 5$, then they really
need to get creative to refill those cardriges.

They did, and you *are* out of date.

Gateway created Amiga International IIRC, which was wholly owned.
However, they screwed around with various half hearted plans, and
various chief execs, and finally sold everything except the technology
patents to a company called Aminos at the end of 1999. Aminos was
owned by a consortium of people, the two most prominent ones being
Bill McEwen and Fleecy Moss, both enthusiastic Amigans and former
Gateway employees. Aminos has since changed its name to Amiga Inc
(http://www.amiga.com) and they hold all licensing rights to Amiga
technology.

There's quite a lot going on in the Amiga scene at this time.

Ok, not a good example, I'll pick another one, what if Linux integrated a free web browser into it's interface? What if (hypothetically) this put someone out on the street. What could the government do? Should they do anything?

> Kerberos is the perfect example.

> web.

This is where that double edged sword could hurt Linux. If the government is empowered to bitchslap developers who change protocols to extend them, could not this empowerment also be used to bitchslap developers who reverse engineer protocols to be compatible?
I think the safest ground we could stand on would be that protocols be considered speech, and be given the same standing constitutionally. (Posting the source code is a different story.) Let Microsoft extend whatever they feel like, we'll be right behind them developing tools that integrate nicely with those changes. Both these practices should be protected, as attacking one hurts the other.
This way, any percieved improvements are realized by consumers, regardless what product they choose, and competition is still occuring, with the consumer benefitting from the race. That /is/ the only thing the government is supposed to be concerned with in a monopoly case anyway.
Consumers do not benefit in any way by having the government soft-

enforcing a protocol tweeking taboo.

If you look closely at what's happening to GUI's right now, Microsoft /is/ competing, everyone is. Apple is making drastic changes in it's UI, Linux is also, and Microsoft is changing the GUI at a faster rate than they have ever done anything before. This race they're having is picking up speed and the consumer is benefitting on all fronts. And this is how it should be.

What we don't need right now is Big Brother stopping this race, so that Linux and Mac might slow down, and then we lose because competition has stopped again. Besides, it's getting interesting ;)

What I did to get a decent supply of cartridges for my HP 560C (paid
$7.00 for it at Goodwill) was buy up more printers at the thrift stores
averaging around $5 - $7 each (half that sometimes depending on what
color tag is on sale), pull out the cartridges, then redonate the
printers. One of them even had a couple extra sealed cartridges (2
black and one color.) So I'm set for a while.

I always thought most implementations of Linux included Netscape
Communicator anyway. And Opera would be a good alternative (rapidly
becoming my primary browser under WinBlows-98).

Not true, We sell other OS's, give us a call for a quote, and I'll prove
it.
Microsoft doesn't impose those restrictions on us.

Gateway had other motivations for wanting Amiga.

Compaq puts out other OS's, ones that compete squarely with NT/2000!
Dell, IBM offer Linux.
Not to mention SGI offers unix.

Not sure where this rumor started, but I've heard it before.

Some do, some don't. (Debian, for instance, can't under its license.)
You also often get lynx, links, KDE's browser (Kylix? I forget) and so
on.

This is very different from integrating it into its interface, or some
other such nonsense which assumes all OSes work like Windows.

Nothing. Linux is not the product of a company that has a monopoly. So none of
these questions apply.

> Should they do
> anything?
>

But they aren't so empowered.
It's really very simple. The rules you have to play under change once you achieve
monopoly status. You may not use your monopoly to maintain or extend your
monopoly. So Micro$tuff is a very special case that doesn't apply to hardly any
other high tech company (possible exceptions: Intel and IBM [IBM once came close

to a breakup because of it's abuse of monopoly power, they backed down and played nice, something Micro$tuff doesn't seem to understand how to do])

Roy

> could not this empowerment also be used to bitchslap

Here's how it has worked with their "extensions", they made changes to Win 95 and Win 98 at the request of the Office programmers. Not too much wrong there. They made such changes available to the WordPerfect and Lotus Suite programmers, once those programmers learned of the existence of the changes, and then asked for the information.

Do you see the difference? In house products teams had weeks, if not months lead time so their products were out first, and had a much closer working relationship with the Systems programmers than ANY competitor could possibly have. That allowed the Office products to maintain and extend their lead over their major competitors. American law prohibits that as unfair when done by a monopolist.

The kicker is that Micro$tuff is STILL denying that they have a monopoly. I suppose they would only acknowledge it when/if they achieve their wet dream of all computers everywhere using M$ OS.

Ah, but what happened to DRI?
How often do you see the Lotus Office Suite (assuming IBM didn't finally throw in the towel) bundled with a computer? Or the WordPerfect suite? How much shelf space do they get at the Best Buy, Office Max, Office Depot, Circuit City, compared to M$??

>
>
> What we don't need right now is Big Brother stopping this race, so that

(sigh!) you're missing the point. Make something up yourself. We're not
talking about what linux is, we're talking about what the government
should be/shouldn't be able to do.

Anyway, linux isn't like /anything/, "linux" is just a kernel, I can
make the "linux OS" anything I feel like dear. kernel 2.4 has a built in
web-server, by the way, by "built in" I mean right in the kernel.

Not even Microsoft has a webserver in the kernel, so, how does "linux
work" again? ;)

Nope.

> Make something up yourself. We're not
>talking about what linux is, we're talking about what the government
>should be/shouldn't be able to do.

And you're making some spurious links to Linux, not understanding the first thing about what you're talking about.

Remember: Just because MS do their Operating Systems one way doesn't mean all Operating Systems work that way. Hence, what the Government do there doesn't apply to some other OSes - because it's entirely irrelevant to them.

Government: "Microsoft, no integration of browser with OS!"
MS: "Squeak! Yes sir!" (eventually, maybe)
Government: "Linux, no integration of browser with OS!"
Linux: "Erm, we don't."

You're trying to make links between two entirely incompatible situations. What a Government can/can't do with Microsoft is entirely different to what it can/can't do with Linux - because the entire system doesn't work like that.

Free clue: When giving examples and analogies, try harder to make them relevant.

The question was hypothetical, the situation posed in a hypothetical
question need not be fact. The question I asked was "what if", and it's
an interesting question, what if Netscape decided to become available
free with every linux disrobution and became the almost exclusive
browser? what could the government do?

A monopoly means more than "most people use Microsoft." Microsoft does
not have a monopoly. Even, of all people, RMS has stated that everyone
has a choice of what OS to use. A corporation is not a monopoly because
the free will of the people chose one product over another.

Case in point: IBM, you /could not/ built an IBM PC without an IBM PC
BIOS, therefore IBM had complete /exclusive/ controll of the market,
regardless of the purchasing decisions of the consumer. This is what a
monopoly is.

(By the way, we broke that monopoly by reverse engineering the BIOS,
see? Kind of like the kerberos example. The court should do the same
thing they did then, allow an implementation of that functionality to
be duplicated.)

Microsoft, on the other hand, was voted to where they are now by the
purchasing decisions of the free willed people. There are alternatives,
for crying out loud Microsoft has one of the hardest competitors in the
world to compete with, a competitor who /gives it away/ (sound
familliar) and has both the popular and (arguably) technological
advantage over them. Not just in the OS market, but (especially) the
server, and (mostly) the webserver market. Microsoft's momentum is
/hardly/ increasing, and more and more options are developing every day.

> Win 98 at the request of the Office programmers. Not too much wrong there. They
> made such changes available to the WordPerfect and Lotus Suite programmers, once
> those programmers learned of the existence of the changes, and then asked for the

> information.

A lot of competing companies had inside knowledge of Windows, look at
Adobe. Adobe knows more about the inner workings of the Windows Print
architecture than Microsoft. You know why? Adobe /designed/ it! The
public was highly skeptical about the quality of it before release, so
Microsoft called Adobe in and had them completely overhaul the entire
print archetecture. (there's actually a neat story behind this too)
How about the inner workings of Microsoft Networking and the NetBEUI
protocol? Did you know that it was ProComm who put that there? NetBEUI,
Microsoft's "plug-and-play" networking protocol, was purchased from
them.
Adobe has been successful in Windows printing, Procomm in networking.
Microsoft doesn't even have the edge on alot of the code they themselves
distribute.

> Do you see the difference? In house products teams had weeks, if not months lead
> time so their products were out first, and had a much closer working relationship
> with the Systems programmers than ANY competitor could possibly have. That
> allowed the Office products to maintain and extend their lead over their major
> competitors. American law prohibits that as unfair when done by a monopolist.

But the fact that others were developing and releasing competing
products, and making money doing it, precludes Microsoft from being a
monopoly at that point in time. If you remember, Lotus was very
successful. In the end we mostly moved to MS Office because we liked the
product better, if we didn't we, to this day, still have the choice of
using other products. StarOffice comes to mind as an excellent
alternative (I can't stand the interface though)

> The kicker is that Micro$tuff is STILL denying that they have a monopoly. I
> suppose they would only acknowledge it when/if they achieve their wet dream of
> all computers everywhere using M$ OS.

I deny it too. I have plenty of options. I'll deny it untill there arn't
any options. Then it will be a /monopoly/. A monopoly means NO options.
Like Bell telephone, IBM making the only machines with an IBM BIOS.
OPEC. Let's face it, it was Darwinism that built Microsoft, it's
Darwinism that will bring it down, and it can and /is/ happening.

>
> On yeah, and how much has their market share gone up?

Not relevant. It certainly can't be because of Microsoft Office,
because Office on the Mac is better and more stable than Office on the
PC (from what I've heard). This is (from "what I hear") typical, I hear
Photoshop and alot of other apps that exist on both Windows and Mac are
better on the Mac. This tends to put a few holes in the theory that
Microsoft giving inside Windows OS info to Office developers made
windows more popular, because that Windows OS Office is supposedly
inferior to the MacOS Office, regarless of "inside knowledge"
And the kicker is, You can have all the inside knowledge of the MacOS
you want now, at least the "Darwin OS" parts because it's OpenSource. So
according to the inside knowledge leads to market monopolization theory
posed, the Mac should be cleaning up, right? So how much /has/ there
market share gone up?

> > Linux is also,

> compared to M$??

About the same amount as the customers ask for them. Shelf space does
not a monopoly make, When I decide what to stock, it's based on demand,
and customer demand is the free will of the people, nothing more.

> > What we don't need right now is Big Brother stopping this race, so that

>
> You won't. Big Brother might slow down M$, but not competitors with less than 10%
> of the market place. In a case like this, Big Brother's job is to make sure that
> the race is fair to the little guys.

And what have the "little guys" been doing? Generally nothing untill
Microsoft develops something they need to compete with. There's been a
lot of companies resting on their laurels untill they /have/ to improve
something because Microsoft is killing them. Don't believe me? let's
take a closer look...

PalmOS, who swore up and down consumers don't need color. fine everyone
settles for b&w, and Palm own3Z the market. WinCE comes along, and Palm
responds with the new color models, but by now they're already losing

market share daily, and the palm VII I *just bought* is now on fire sale as best buy for half the price I paid a few months ago for it.

Novell, once prime master of the universe in networking, decided it didn't want to make a VXD implementation of Novell client for Microsoft right away, they decided their legacy .386-file architecture was all anyone needed. Microsoft, who at first didn't even install networking protocols in win95 by default, and even included a limited novell client, responded to the delay imposed by novell by incorporating NetBEUI (mentioned above) as a stop-gap measure untill novell woke up to consumer demand. Too late. novell is now largely irrelevant.

OS/2, an Operating system more object oriented than Windows is /to this day/ practically abandoned by it's creators even though people are practically begging them not to discontinue it. It's still a staple in most banks and runs a majority of the ATM machines out there. IBM has publically stated they don't plan on supporting this OS.

BEOS, a very capable OS, but one that it's creators have no interest in persueing, deciding they want the embedded market, despite a loyal following of users and tinkerers. Heck, by the time I even discovered BEOS, they had already abandoned it!

On the other hand, there are very good developers out there that make a killing competing against Microsoft because they are /good at it/ and the consumer /prefers to use them./ Adobe is a prime example here, as are Macromedia, Citrix, Borland, Sun, AOL, Symantec, Peachtree, Intuit, and many others. They have prospered because we vote for them with our patronage when we choose them over Microsoft. They have responded to the demands placed upon them by the consumer, faster or better than Microsoft has, and thus prospered. This is how it oughta be.

Some people may feel sympathetic to Netscape, but the fact was they were charging money for a product that could have taken on microsoft and won, but they decided they preferred to be Adware instead. they could have improved their product, but they decided to open a portal during the portal craze and rest on the portal, and their laurels. If Microsoft didn't do it, someone else would have.

that's the thing in a free market, you live with the fear that someone will be faster, better or cheaper than you are. You adapt, or you win the Darwin award.

Anyway, back to your original comment, the government's job is *NOT* to make the race fair to the little guys. the goverments job is to make the race fair and beneficial to the *consumer*, even if it means the "little guy" goes out of business. the government has the power to grant monopolies for this purpose so long as it benefit's the consumer.

But again, Microsoft is where they are because we put them there, and it's in our best interest to let them compete.

Actually, now that we somehow got our shirt stuck on this nail that
wasn't relevant to the subject at hand anyway, just kind of provided
like a freehand sketch for those that lose interest in the text without
pictures version...
```

Linux is not an Operating System. It's not up to "Linux" what gets integrated into the OS. Redhat, Slackware, ect are Operating Systems, They decide what gets integrated into the OS. Linus is just a kernel.

The Analogy was NOT between "Windows and Linux", The analogy was between two "Equally /available/" operating systems. the consumer has the same access to one as the other, illustrating something not true in a monopoly.

As for (re: linux) "They don't do that", who are "They?" and what dictates what "they" do? Is not Linux open for anyone to do what they please? In my "Linux on an Amiga in a Box" half-hearted kill-time project I work on ocassionally, should I contact "them" to find out what I can and cant do because "we dont do that?"

Unless Linus has contacted the hundreds of copyright holders on the various pieces of code, and they all decided to stop distributing the source under the GPL, I'm pretty sure I can integrate anything I damn well please into the kernel, or my OS. Of course it will be tricky, as I'm using the uClinux kernel so as to make it work on older Amiga's without an MMU/and UAE, and I can't get the file system to work, even though everything "should work" (I'm abandoning it soon I believe, I've decided it's time for a new project, a gnutella client that doesn't suck)

Back to the point, the question (again) isnt like you said, "What they can/can't do", I asked what they "Should/shouldn't be allowed to do", this isn't a question of opportunity or current legal precidence, but a hypothetical question of ethics and what level of government inervention is beneficial to the consumer, and why.

The answer to that question is they should either A) side with the small businesses being hurt by Microsoft, or B) side with the consumer, who chooses to use the Microsoft product over the competitor.

I wasn't expecting C) "Linux doesn't work like that", and I apologise for my foggy analogy. The illustration was an afterthought ;)

Linux doesn't need to "incorporate it into its interface" in the way you
mean... There are several free web browsers included with every linux
distro. And yes, depending on which windowmanager/desktop environment you
choose, there are integrated ones. But not of them are forced on the user.

And as the source code is free... It would be easily UNintegratable if
someone DID want to reassert their choices.

>> Kerberos is the perfect example.

Think of it this way. Someone working on FreeBSD wrote that kerberos
protocol. OK, he released it under the FreeBSD license, but when M$ extended
it, did he get anything for it? Did he even get to see the changes?

That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code
legally without releasing any changes they make back into the community.

> I think the safest ground we could stand on would be that protocols

> be protected, as attacking one hurts the other.

fine... let them keep the source, but they DON'T publicise the actual
protocols... Hell, even their own protocols (word document format anyone?)
aren't fully compatible with each other in an attempt to force people to
needlessly upgrade their software.

Anyone who can use a command line as per the Apple II shouldn't find adapting
to Linux very difficult. It is only GUI users (like Windoze) who find things
"unfriendly".

I think you are missing the point. Rolls Royce still make cars to a standard not to a price. Kit cars (usually VW based) are still available. I think a "kit computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Why should they have to though? What extra power would my parents get (word processing, internet, dtp, spreadsheet) by using Linux over Windows or her Mac (actually my old Mac)? What advantages would I have in using Linux over Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder, SQL Server etc?

> --
> Security-wise, NT is a server with a "Kick me" sign taped to it.

And there are not dozens of known security holes in most Unix/Linux distributions? Every scanf(),gets(), sprintf(),strcpy in the OS is a potential security hazard.

sigh

Which particular Linux "interface" are you referring to?

Free clue: Linux doesn't have any one single interface into which a web
browser can be integrated, unlike some other OSes. Similar things apply
to many Unix derivations/clones/flavours etc. Given the open-source GPL
nature of the Linux, it would be nigh on impossible to integrate
something in a manner such that it couldn't be unintegrated and, in many
ways, Linux is essentially the kernel and helper apps. The interface is
virtually entirely customisable, since all the kernel hooks are well
documented and available to all.

But it seems like that's how the hardware support comes about. It seems like you pretty much have to buy peripherals that have been out for about 3 years to get full support in Linux.

This right here is what I am thinking. A lot of other posts in this thread have talked about PC components. Come on people! PCs are no fun! We all like our obsolete computers (whether you consider them obsolete or not, I personally couldn't find anything useful to do on my Atari if I tried) right? We just want something a little more powerful so we can do all the things we need to do and throw out those stupid PCs which are just a bunch of parts sloppily thrown together. Even if there were an OS for PC that we liked it wouldn't matter much because PC hardware just sucks. Maybe you don't agree but this is certainly my opinion. I'm an assembly language person and I find C++ (the language that "everyone" uses now) to be completely unnatural. It isn't practical to program PCs in assembler because there is so much different hardware (can't find programming info for most of it either) and because most of it looks like it was designed by crazy people.

Sooo... I use my PCs for internet access, for games (just emulators and Doom network games actually), for playing music, the occasional school assignment, and for programming (for non-PC systems of course, like the Turbo Grafx 16 for which I've written half of an RPG in Hu6280 (like a 6502) assembly). One of the many things I like about my Atari is the fact the motherboard is not too dense, I can go in and unsolder stuff and solder other stuff on. There is no way to do that with a PC motherboard (at least on anything newer than a 286) because of all those tiny little pins on the chips and the four-layer construction. Taking all of this into account, my system would look like this:

1. nice, simple CPU (since I'm a fan of the 6502 I'd use one of those great Western Design Center 65816's. one of those eZ80s that I've heard about would be good I guess. 80x86 chips are out of the question of course), with a clock speed

in the double digits (decimal digits, not hex :))

2. 2 MB or so of RAM would be fine for what I'm doing

3. A cool video chip like old computers had, that means something other than just a frame buffer and a DAC, something with sprites and layers and maybe polygons. I would like something with 256 colors at 640x480 (the V9990 chip used in the 3DO would be great, the chips from the later MSX computers would be OK)

4. A likewise sound chip, something with 16-bit stereo PCM but also with some good old FM channels or square waves or something

5. an EIDE interface

6. built-in ethernet

7. some REAL joystick ports (the kind where you read a register and each button is represented by a bit)

8. expansion slots

9. An OS which isn't bloated and slow, which includes a command line interface, and which isn't designed to protect idiot users from themselves

Perhaps within the next year or two, when I have some money and some time, I'll build something out of a 65816 development board. Then again, I might spend all my money on mods/paint for my BMW (which is around the same age as my Atari 8-bitter of course).

And I answered your question with a real world answer. The US government, at least does not now have that power. The only power they have to do anything like you asked is only if the corporation in question is a monopoly, and is using it's monopoly power to extend or maintain it's monopoly.

Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that), and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless you first suggest that Congress passes a law that isn't even in question, and that the President's veto isn't overridden, and that the Supreme's say is constitutional. That

isn't hypothetical, that's a chemical induced nightmare. ;-)

> not have a monopoly.

Monopoly does *not* mean that *everyone* uses your product. AT&T was a monopoly, even though there were several other competitors (GT&T, IT&T, here in eastern Nebraska there was LT&T, and so on), AT&T was a monopoly because they had a super majority of the business, and there was no way that any of the competitors could take the monopoly away from them.

Besides, your opinion doesn't count, and neither does mine. The trial court found that M$ *is* a monopoly, and the appeals courts sustained that decision.

c. 90% of computer desktops does equal a monopoly.

> monopoly is.

LOL - no, not at all. Ever hear of Phoenix bios? Award Bios? Ever hear of Dell, Compaq, Tandy? They all made machines that were IBM compatible, and IBM long ago lost control of the market. How silly of you.

IBM's monopoly was in mainframes, and even there they had competition. But they used their monopoly power to squeeze the competition, which is why the Feds came down on them. IBM settled out of court. M$ isn't that smart.

>
>
> (By the way, we

We?

> broke that monopoly

Read the above. You don't have enough information here to debate this intelligently.

> thing they did then, allow an implementation of that functionality to
> be duplicated.)
>
> Microsoft, on the other hand, was voted to where they are now by the
> purchasing decisions of the free willed people.

Not really. M$ makes their money on Office not Windows. And of course, not on Explorer. But Navigator was a threat to Widows as a platform on all OSes, and therefore a threat, in time to Office and M$'s monopoly.

So they cheated.

They did what was illegal for them to do at that stage.

> There are alternatives,

Oh yeah, GEOS is taking the world by storm, isn't it?
How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears, and Walmart have Linux pre installed on them? Have you seen ANY??

How many machines do you see in those stores that have applications software (Works or Office type) that are made by a competitor of M$? Have you seen ANY?

>
> for crying out loud Microsoft has one of the hardest competitors in the

You don't have to have a monopoly in every niche to be a monopoly.
And Linux hasn't won even in these fields - yet. It certainly doesn't have a monopoly even in those niches.

> distribute.

Adobe isn't selling an Office suite either are they?
Office is M$ bankroll.
By the way, how much do you hear about Novell and networking any more? A real powerhouse like they were in the early 90's right?
And M$ often buys technology, that's not news. Nor does it have anything to do with their having a monopoly in Office Suite or on Desktops.

Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in part, because M$ bought such technology and incorporated into their software, so consumers didn't need to buy and so didn't buy such products.

See, that's a real problem. If you get M$ Office for free, why would you buy WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a browser for free, why buy one?

And when such actions are done by a monopolistic company, it's illegal.

Hm? With the possible expection of SB Live!, my keyboard and mouse and
disk drive (newer than three years, but the designs are not changed, I
guess), there's no components that are even nearly three years old on
my Linux box.

(Other hardware includes TB 1200, A7M266, Geforce 2mx, two IBM
Deskstar HDs, HP 9120 CD burner and two NICs - all which is rather recent)

Didn't have a single problem with this configuration.

Then again, I'm not using USB stuff but rather more 'traditional'
hardware.

Nice use of the cut and paste function. Your technical knowledge is impressive.

You are still an idiot.

This one's easy (although I wouldn't say Red Hat "sucks")

For starters lets take a look at the included version of GCC.

Can you even recompile the base kernel with it?

I wouldn't say any OS sucks because of the "ease of installation"
because if the OS is worth it's salt, you're only going to install it
ONCE anyway.
However, the compiler thing, I just have to sit back, shake my head and
wonder what WERE they thinking?
```

Easily, maybe, I can also easily unintegrate IE from Win98 too, there is
a way to do it ;) (Was quite an embarassment too, after MS said they
couldn't!)

In my personal opinion, I really hate the BSD license, for this very
reason. I mean, it's fine if you don't WANT to see your code when it's
reused, but I wouldn't choose it.

> That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code

That's why I save everything in Word 6 format ;)

In the case of kerberos, they did publicise it, in fact, they publicised
the source code. While the NDA keeps you from using that source code, it
doesn't keep you from implementing the protocol.

LOL I love that line ;)

There are things in linux that it really is harder to do than in
Windows, but these things (like routing, wierd protocols like PPPoE)
are things usually done by someone who should probably spend a little
time learning anyway.

Sure linux has a learning curve, but it's a freaking computer, when did
the notion that computers had to be usable by people who didn't want to
learn anything become popular?

```

The question (as posted in another article) had nothing to do with the
power they now have, but what power they should have, and why.

> Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that),
> and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless
> you first suggest that Congress passes a law that isn't even in question, and that the

But the question was what if they were, saying "but they're not" changes
the question.

A monopoly means the consumer has no choice. As for AT&T, I never had a
choice. I can choose alternatives to Microsoft.

> Besides, your opinion doesn't count, and neither does mine. The trial court found that

That proves my point, the government didn't break them up, Phoenix made
a clean-room implementation of the BIOS, allowing machines to "truely"
be IBM compatible.

> IBM's monopoly was in mainframes, and even there they had competition. But they used

We're not debating technology, this discussion is about what benefits
the consumer.

I'm sure you could think of an alternative if you tried.

> How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears,
> and Walmart have Linux pre installed on them? Have you seen ANY??

I sell them. If you wanted one and can't find one I'm sure I could hook
you up.

> How many machines do you see in those stores that have applications software (Works or
> Office type) that are made by a competitor of M$? Have you seen ANY?

Emachines come with StarOffice, and are sold at OfficeMax, among other
places. We offer Corell Office 2000 in addition to MS Office 2k, along
with StarOffice and a few others.

> And Linux hasn't won even in these fields - yet. It certainly doesn't have a monopoly
> even in those niches.

The problem is that "monopoly" is becoming too loosely a term. Microsoft
may be guilty of unfair marketing practices, but "monopoly" they are
not. There are choices, and the consumer can choose anything they want.

The governments role is *not* to protect other businesses from
microsoft, but to protect the *consumer*, and right now, the consumer
has choice. if the government happens to do something like pull a
product that the consumer WANTS, then the government is stepping on the
rights of the consumer in favor of the businesses that wern't chosen by
the consumer.

Adobe competes almost squarely with Microsoft Office in many areas.

Pagemaker -> Publisher happens to come to mind.

> By the way, how much do you hear about Novell and networking any more? A real
> powerhouse like they were in the early 90's right?

This was mentioned in another post, they dropped the ball when Win95
came out. What happened to them was they rested on their laurels. They
failed to create a .VXD architecture based client for Windows,
overconfident in the believe the consumer wouldn't mind running the
legacy .386 architecture client. The same thing happened to After Dark,
which failed to rewrite their 16-bit code. This was not Microsofts
fault.

> And M$ often buys technology, that's not news. Nor does it have anything to do with
> their having a monopoly in Office Suite or on Desktops.

But it does have to do with the misconception that they have "inside
knowledge," when there are many people with inside knowledge to the
Windows OS.

> Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in
> part, because M$ bought such technology and incorporated into their software, so
> consumers didn't need to buy and so didn't buy such products.

Stacker was a dangerous product, as is any disk compression that is
filesystem based. They became irrelevant because HDD's became cheap. I
don't even USE compression on my drives, do you? After Dark was a legacy
application that insisted the consumer should be satisfied with a 16 bit
application in their 32 bit OS.

> See, that's a real problem. If you get M$ Office for free, why would you buy
> WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a
> browser for free, why buy one?

So the government should side with the small businesses over the
consumer? By that logic I suppose the government should ban TV news to
protect the newspapers which you must purchase.

Anyway *NOONE* gets MS Office for free, you might recieve it bundled
with a computer. but it's included in the price of the computer, it's
NOT free.

You don't think someone will buy a product just because they have one
that's free already? Why would anyone buy Windows then? Or the
newsreader I'm using now when I already have the MS one? When there is a
BETTER product, people will buy it.

This decision is best left to the consumer.

> Andy please elucidate on _WHAT_ sucks in Red Hat?

Everything. The entire user experience from start to finish. A few notable points:

The installer *still* complains if you try and put a boot partition above 1024 cylinders and absolutely refuses to allow you to continue (unless you go with it's suggested partition arrangement in which case it just suggests that you don't do that[1]) despite being perfectly capable.

The hardware detection is pathetic compared to other distros. Even simple things like making some use of the Windows key which is on almost all keyboards these days isn't done for you.

The configuration tools are scattered all over the place, all work differently and most are quite counter-inituitive. The auto-update is rubbish compared with the Mandrake equivalent, requiring you to faff around with their website[2] and send them all the sorts of details that everyone was worried Microsoft would want from you when they thought up Windows Update.

Need I continue?

AndyC

[1] And what the f*ck is the point in "recommending" a partition arrangement if you are then going to announce that it isn't recommended.
[2] Which, stupidly enough, only seems to work properly in Internet Explorer under Windows.

Indeed. Of course the trouble with the Linux community is that they just
aren't devious enough. They should've taken Kerberos, added their own
proprietary extensions and then released them under the GPL.

Hmmm, where's my compiler gone...

AndyC

Not in the real world.

A choice can still be available when a company is monopolistic - like Microsoft, for instance. And most users *didn't* get a choice, because of the licensing agreements with major PC manufacturers which is how a lot of people buy hardware.

I didn't mean to say that you *had* to have old hardware, but I guess it
came out that way. What I meant was that if you have a PC that was
built with no consideration for Linux, you can't reasonably expect all
you peripherals to be fully supported should you decide to install Linux
on it, if the peripherals are relatively new (not the actual cards, but
the chipsets or firmware used).

Yes, I read the comment pretty much as "no new hardware is supported
by Linux; the support comes only later if at all" ;)

It seems to depend quite a lot about the manufacturer; eg. nVidia and
3Com seem to have rather quick support for Linux, whereas some
companies seem to be a real pain in the ass with support lagging years
or infinitely.

Why buy a $300 NEW computer when for that amount of money you could get a very good USED computer? If you added an office suite, a VGA monitor connector and a printer to the Sega Dreamcast (which already has a browser, modem and keyboard available), there's a cheap combo with great games!

A decade from now $300 may be the standard price for a computer with relatively new technology, but the price today is more like $800-1000.

Realistically, you would have to be able to produce a $300 machine for about $50-70 to count in all the other costs, like shipping and returns, so someone would have to think outside the box, so to speak, to get the job done.

I do NOT think a monitor should be included with it. It adds weight and cost. You go to a thrift store and there are lots of monitors there. People also have TVs. The computer should have connections for at least types of monitors: SVGA, RCA and AV for TV/VCR. People can get whatever type of monitor they want.

I also think the day of the all-in-one desktop unit (the Apple IIc, Atari 800, Commodore 64 etc.) should be revived if one wants to be economical. Have a serial printer port, joystick/mouse port, the aforementioned three monitor/TV ports, SCSI port. Built in would be a 33k modem and 3.5 floppy drive for data storage. I wouldn't include CD-Rom. All the necessary stuff should be pre-installed to make life easy.

There would have to be a GUI. Something tight that doesn't slow down the new user. HD let's peg at 1GB and Ram at 64MB and figure the processor is 333 MHZ -- good enought to make the Net move but cheap by today's standards. The builder should work a deal with Lotus or WordPerfect to put a low-priced office suite on here.

These $300 machine won't compete speedwise with their $800 counterparts, but are GOOD ENOUGH for most users. And as the $800 machines get faster/better, so will the $300 machines due to trickle-down technology. Perhaps they will be five years behind the more expensive machines in bits and bytes.

That's my biz plan.

:) We're talking about Microsoft, and you can use Microsoft as your
example of precidence? "Microsoft can be a monopololy even though there
are choices, take Microsoft for instance?"

> And most users *didn't* get a choice, because
> of the licensing agreements with major PC manufacturers which is how a
> lot of people buy hardware.

They chose to buy a PC with Windows on it, they had a choice. If anyone
here can find me a PC they want, and they don't want Windows on it, I
guarantee I can find it somewhere else, with the same warranty, support,
and hardware, at the same price, with another OS on it.

Even during the time when Microsoft had exclusive licensing clauses
(ended around 1993) there were options. I mean, heck, look at this
newsgroup.

Do you really think that everyone with windows on their computer was
forced to use it? I guarantee if you take a poll and ask people buying
new machines, and ask them what OS they want on their new PC, it will be
Windows. The people who want something else will buy a machine without
Windows. (Personally I've never purchased Windows, but I get developer
versions via MSDN, and beta versions like the XP I'm using now)

Here's the real world situation. Microsoft can't touch Apache with IIS
in any of it's incarnations, and it doesn't look like that will change,

despite the fact they'll give it to you FREE with Server, and Mindcraft say's it's faster and scales better.
On top of that, after stating "opensource is a virus" Microsoft has egg on their face because they just cant for the life of them get hotmail to work without good old BSD holding the fort, and this is at a time when they're pimping their platform for .Net.
There are Free alternatives to all of Microsoft's products, and ones in developement for products Microsoft hasn't even released yet! Miguel's already pimpin' Mono to work with .Net.
Microsoft's days are numbered, they see the writing on the wall, they know they can't compete with a competitor that they can't buy, undersell, influence, or lock out of the market. The government stepping in right now, would just stop the inertia at a time when they're not needed anyway, they'd take the credit for the inevitable.

Monopoly or not aside, the governments role is to protect the consumer and ensure the consumer has choice. The government's role is NOT to leverage consumer choice for the benefit of Microsoft's competitors. If competitors are cutting each others throats giving away free software, and as the dust settles, the consumer has free software, and netscape's dead, the consumer has benefitted. What then, would the consumer benefit from the government flexing its arms at Microsoft on behalf of these businesses who lost the war to the benefit of the consumer? That's supposed to be how the Monopoly law works, to benefit, for, and ONLY, the consumer.

So where has the consumer lost? The consumer has both Netscape, AND IE, both free, and without the government stepping in where it would have hurt the consumer to do so.

The fact remains, Netscape is just as available as it's always been, if not more so. From the consumers point of view, the consumer has won. From Netscapes point of view, they are legally entitled to financial damages, but they are NOT entitled to having the customers choice overruled by the government on Netscapes behalf.

This isn't really anything more than a political issue I believe, I think this discussion is between the chairs on the left and the chairs on the right. :)

>I think you are missing the point.

Not at all. The "point" was to try to make a "new" computer for $300.

MY point is that NO ONE WILL BUY ONE if it has half the features and
runs at one tenth the speed of a comparably priced system ALREADY on
the market.

> Rolls Royce still make cars to a standard
>not to a price. Kit cars (usually VW based) are still available.

And Rolls Royce has been in financial trouble for quite a while now.

And "kit cars" cost a ton of money, and hardly ever work right.

You can ride to the Space Station if you have enough millions.

But can you build an obsolete hackers' computer for only $300?

> I think a "kit
>computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Certainly, you can find something to fill almost any niche, if price
is no object.

I always lusted after a KIM-1, even though it cost more than our $300
price point, and did very little. Want to guess how many were
actually sold?

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

Well the users have always had a choice, simply to drop the
OEM version of Windows and pay extra for the retail version.
The vendors and dealers were just never any good at informing
the consumers.

Who are to blame, really?

Regards...

That is a pretty strong guarantee. could you make the other OS 'geos'? And no that is _not_ a typo. or hey let's call dell and see if they will preload QNX?

> Even during the time when Microsoft had exclusive licensing clauses

And that is another point. every so often a newbie comes in and asks about this newsgroup(writting from alt.amiga.*), should they get interested in Amiga and the answer is invarible, not unless your in it for nostalgia. The stopped making them because they could not sell enough units. although my personal feeling is that M$ did not kill the Amiga but only handed them the knife.

I think if you take a poll on new PC owners they would not know what an OS was you would be more likely to get the answer Word.
As far as experienced PC owners, what non-commercial OS are they going to ask for? I mean Really, Red-hat is not yet buying ad space in Time, newsweek, or insert-your-favorite-non-Linux-publication-here.

They seem to be doing a pretty good job, and 'Code Red' virus seems to be proving it. But with several companies buying into the 'technology partner' status, and '.net' strategy, it seems to be Microsoft || die.

Last time I checked(recently), hotmail was running windows 2000 on IIS. Yeah shocked me too. I was doublechecking it for accuracy and according to the website I used(I think it was netcraft) they were no longer FreeBSD. Which the NT-vs-Linux.org site needs to be updated cause that is the link I _was_ referencing in conversations.

Microsoft is not dead, possibly dying but I don't think so. They have very low overhead for the units they sell. Nobody is going to unseat them, I offer the following quote from an advert in the paper..."Please send your

resume in word doc format." When your the standard the other guy has to be twice as good to unseat you.

See comment about Geos above. When I was consulting, 10 years ago, Geos was considered by some to be "better" than windows. For 3.10 that was not a huge challenge. But it's dead now and the company's only claim to fame is a (silly)patent on WAP. Is the consumer protected by geos' inexistance? Was Microsoft the first company to produce a software product called internet explorer? what happened to that company?
Was the lesson of geos, and the company who originally owned the copyright to the name to "internet explorer" as a program a benefit to the consumer?

It wasn't that MSIE was free, it was that you couldn't get windows without it. It would be like firestone striking a deal with Ford that you couldn't get a shiny new (ford)SUV without firestone tires on it.

> This isn't really anything more than a political issue I believe, I
> think this discussion is between the chairs on the left and the chairs
> on the right. :)
>
I guess you must be sitting on the right, because I know I am on the left. oddly enough I am a Microsoft user, but only the OS. You see I bought the OS because it came preinstalled on my machine before I knew about your gaurantee. I don't have the office suite because I don't have the $450 to buy the non-upgrade copy. (oddly enough though the Corel office competing product is only $100, why is that?) I am writing this from a Linux box on a telnet session because the emulation is better.<rant /> Matt

Bob, you are missing the point. The point is to play with an idea. The underlying question is: if we could create our own computer, how would be build it? The price point is there so that we don't build something, like a quad processor Pentium IV, or what be it.

It does not matter whether this machine will sell, because it is only an idea. Sometimes ideas are good, and sometimes ideas are bad. There is no sole judge of quality and, if there were, it certainly wouldn't be on marketability. In this day in age, the Apple II, Amstrad, Amiga, and Atari have very limited markets. That does not mean that these machines were bad ideas. It certainly does not mean that we who use them have bad ideas.

And even if sales were an issue, I'm sick and tired of this damn "you must own the market to be successful" mentality. To pick on Commodore and Atari: these companies were split up, sold off, and bought by other firms. Does that mean that the Amiga or Atari ST were unsuccessful. Apple's marketshare is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that Apple is a failure? Apple is almost 25 years old. Is Sun a failure, by the same logic? Of course not. It is absurd. If I can make a living while serving a few hundred clients, I would consider myself a success. If I could do that with my 68k proposal. And, as I pointed out, similar machines which are targeted to a limited market already exist in the sub-$300 price range.

Yes, 68k and Z80 based computers are still made. A tenth of the power? Heck, I'll bet that the 68000 is a lot slower than that. Ditto for the Z80 based machines.

The point is: these machines are not targeted at the same market that Windows, or MacOS, or any other entertainment/office platform is targeted at. The TI-89 is designed as a calculator, and the design is directed towards portability and the entry of mathematical expressions. But don't be fooled, this is a computer as powerful as an Atari ST. It is routinely programmed to serve other purposes (assembly, C cross compilers, etc.).

Does TI sell millions of '89s every year? That is doubtful. They offer about a half a dozen different models (again, some are Z80 based and are just as programmable). HP is probably their biggest competitor, in a similarly small market -- and there are others. Are any of these companies

or product lines a failure as a result.

If you want to by your dime-a-million VCR's and Wintel computers, be my guest. If you think that our discussions are illconceived, so be it. But if you are more interested in tearing our designs apart than contributing construtively, I suggest you shut your mouth, add this thread to your kill file, and forget this little band of crazies exist.

Good night, and thanks for puting me in a foul mood,
Byron.

Actually, I don't think Microsoft had anything to do with it, Commodore
couldn't market pardons in prison. They had a bad habit of marketing to
customers they already had, or "preaching to the choir."

> > Do you really think that everyone with windows on their computer

;)

Most of our customers ask for Windows 2000, thinking it's 98's next
version. Then they ask about the Millenium version, so we tell them that
it's WinME they're thinking of. The ones who don't ask about the OS just
assume that Windows "comes with" their computer, they also assume
MSOffice comes with it also.
Then we hit them with the price. Win98/ME $99 installed, Linux, your
choice of distro, $50 installed.
Some ask, "what do you mean installed?", We respond, "that means we
install it" (as if the HDD was manufactured with an OS on it, sheesh).
"But Gateway doesn't charge for that!", "Yes they do, it's built into
the price they're charging you for the OS, we're not charging you extra,
we're giving you the option of not paying for something you may not
want"

> As far as experienced PC owners, what non-commercial OS are they going to
> ask for? I mean Really, Red-hat is not yet buying ad space in Time,
> newsweek, or insert-your-favorite-non-Linux-publication-here.

Red Hat /is/ a commercial OS, and an "expierenced PC owner" has I'm sure
been flooded with information and hype et al about linux, including from
such sources as... Time, Newsweek, insert just about any major PC
magazine here. In fact, didn't Time do a huge article about Linus and
name him one of the "people to watch" right under (or was it above) Bill

Gates?

;) I don't know if we can look at virus proliferation as a sign of
Microsoft dominance, but it's a funny thought. ;)
I remember several people talking about the P3-unique ID the way some
talk about .net. We'll see how many die from lack of .net.

If you used Netcraft to check their servers, you were seeing a straw
man. You'll notice a few weeks ago netcraft identifies them sometimes as
"BSD" sometimes as "2000" and I even saw a "???" listed, MS is playing
games putting an "airgap firewall" up. (which by the way, is actually
good security practice, my firewall is linux, but it reports itself as
NT4 :) It's harder to hack if you don't know what you're hacking)
But Microsoft has recently stated that they were using BSD, and that
the transition would be gradual so as not to effect the user. This has
been going on for a while now.

You don't have to unseat Microsoft, and they don't have to die, they
will simply become less relevant over time, Like the term "Word Doc" is
less relevant now, since like Kleenex, many Word Processors can save to
Word Document format. Sometimes common usage is a bad thing for the
trademark holder, it can be a sign of evaporating relevance.

Geos still exists. They simply renamed themselves "New Deal Office" and
are marketed at Doorstop-technology machines, like old 486's. They
wern't squeezed out of the market, they chose a niche, that they are
currently filling.

> Was Microsoft the first company to produce a software product called
> internet explorer? what happened to that company?

They sold their rights.

> Was the lesson of geos, and the company who originally owned the
> copyright to the name to "internet explorer" as a program a benefit to the
> consumer?

Considering the consumer gets it free? How is that not a benefit? The
consumer also gets the competitors product free also. I can't think of a
way that the consumer has lost, can you? And guess what? there's more!
If you have a hankering for something different, there's Arachne for DOS
(free) and Opera for Windows, get this, selling their browser, in spite
of Netscape and IE being free. You know why, they built a browser that
suits the needs of some people who are willing to buy it where as the
free ones didn't. (actually tried Opera, didn't like the MDI-windowed
interface, but it was fast!)

I hate to break it to the Netscape people, but netscape was a pain in
the ass quite often, up untill V6 anyway, 6 looks good. (Why couldn't
Mozilla use 6's interface instead of that legacy 4.7 crap?)

> > So where has the consumer lost? The consumer has both Netscape, AND IE,
> > both free, and without the government stepping in where it would have
> > hurt the consumer to do so.
> >

> Without AOL would netscape 6 even exist?

Probably not, or at least it wouldn't be as good as it is now. The same, however, can be said for IE. Would IE exist, as it does now, if not for Microsoft?

> > The fact remains, Netscape is just as available as it's always been, if

But if they decided to give you the tires for free, to keep, and you had the choice to take that money and buy your own tires, in addition to keeping the firestones, well,hey!

Demand.

You should have bought the PC from someone who could have sold you an OEM MSOffice. (well, assuming you bought them at the same time anyway)

Here's a tidbit, we make more selling Correl Office Suite than we do MS Office. Last time I ordered Corel (OEM version mind you, but the whole Office Suite) it was $14 my cost, we sell it for $95 installed, with correl Office ServicePack3 patched and all. Should be a National Average price, since I had to get it from Ingram Micro.

> I am writing this from a Linux box on
> a telnet session because the emulation is better.<rant /> Matt

Writing this from Microplanet Gravity on WinXP RC12505 (gettin RC2 tommorrow!) Microsoft's newsreaders suck. It's worth the price for

Gravity. (I just didn't care for Agent, it felt like a 16bit app, just me?)

And where, pray tell, would you get, for example, a Dell Precision
(complete with cool case, quirky motherboard arrangement and proprietary
power supply) preloaded with QNX?

Or did you mean "I can find something a bit like it somewhere else"?

AndyC

I think the biggest reason for this is that most of the people (not the technogeeks like most of us here in these newsgroups) simply don't know about the alternatives. Your average computer user will most likely get their new overpriced system at one of the big retail chains such as Circuit City, or Fred Meyer, or whatever. When they walk into one of those places and look over the selections, they will see the stats on the display models, and it will most likely list some form of Windows, some form of MS-Office, and probably a trial subscription to MSN or AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).

As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.

So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

>Bob, you are missing the point.

Actually that's not entirely true.

This thread has split into several directions from the original question of what a $300 "home computer" would look like.

Some of the threads I've stayed out of, since I really don't have any experience with the esoteric CPUs that have been proposed (other than knowing that they ARE esoteric).

Other threads have pointed out that successful, well appointed $300 computers already do exist, with no necessity of leaving out CD-ROM drives or I/O ports as the original post suggested. Those I've participated in, my response was one of the first ones actually, with the comment that I just bought a very nice, new PC for less than the suggested $300 price point, with nothing left out to cut corners.

More threads have questioned what the potential market for the proposed new system would be. This is where my questions about the marketability of a system like this have fallen. Unless the proposed audience is only the handful of people participating in this discussion, then the question of the market for any product has to be addressed.

(Yes, I know this is all hypothetical, but it's still a valid question)

> The point is to play with an idea. The
>underlying question is: if we could create our own computer, how would be
>build it? The price point is there so that we don't build something, like
>a quad processor Pentium IV, or what be it.
>

Oh, I'm very familiar with the idea of kicking around concepts- the question comes up on a regular basis in the Atari newsgroups. It's

usually phrased something like "What CPU would you like to see in a new Atari ST clone?" And it goes back and forth, much like a lot of this discussion has, with no one really ever believing it really could happen, but it's just fun to talk about.

>It does not matter whether this machine will sell, because it is only an
>idea. Sometimes ideas are good, and sometimes ideas are bad. There is no
>sole judge of quality and, if there were, it certainly wouldn't be on
>marketability.

Well, the original post presented the idea with a definite slant toward the marketability question.

Why propose leaving out such features as a CD-ROM drive to cut corners down to the $300 point if marketability wasn't an issue?

The original question was presented as if a new "hackers" computer might be a viable product, if only the cost could be contained to a reasonable level, similar to the "good old" machines we used to tinker with.

>In this day in age, the Apple II, Amstrad, Amiga, and Atari
>have very limited markets.

I would say they have ZERO market, but there are those among us who might get upset at that.

People still buy wax cylinders for Edison phonographs but that doesn't mean there's a viable market for them.

>That does not mean that these machines were bad
>ideas. It certainly does not mean that we who use them have bad ideas.
>

Definitely not. The current situation (for anything) doesn't change the history attached to anything.

The Apple computer was groundbreaking. It brought commercial success to the brand new microcomputer world truly for the first time. All the earlier attempts were close, but no cigar.

Atari was the most technologically advanced computer of its time. It's coprocessor chip set was far and away better than anything available when it came out. The fact that Atari, Inc, and Atari Corp couldn't figure out what to do with it doesn't take anything away from the computer itself.

The Commodore 64 was THE most successful microcomputer of ITS day. It was the best selling computer in the entire world, at that time.

The TRS-80 was a solid, well marketed system. It was headed in the right direction with its business applications. You could buy one in a million Radio Shacks.

All of these were good ideas, at the time.

You'd have to be crazy to try to sell any one of them now.

>And even if sales were an issue, I'm sick and tired of this damn "you must
>own the market to be successful" mentality.

"Owning the market" is an unusual situation. Generally there are
several competitors, each with its own market share.

The auto industry has many players, but they all provide a
"standardized platform". When you buy a car, you get the same four
wheels, the same steering configuration, much the same control
mechanism. There are variations, of course, but the basic product is
built around a standardized platform.

The computer industry has standardized on a platform as well.

> To pick on Commodore and Atari:
>these companies were split up, sold off, and bought by other firms. Does
>that mean that the Amiga or Atari ST were unsuccessful.

Those are not the reasons why the Amiga and ST were unsuccessful, they
are the result of the products being unsuccessful. The companies
might have survived if the products had been successful and had sold
well.

> Apple's marketshare
>is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that
>Apple is a failure? Apple is almost 25 years old.

That makes Apple far more of a success than any of the other companies
mentioned. Those other companies are all dead.

Simply by surviving for 25 years, Apple has succeeded.

Apple does that by selling products people want to buy. They've had
failures, sure, but they generally learn from them and bring out other
products that are more successful.

> Is Sun a failure, by the
>same logic? Of course not.

Sun has a very good position in its chosen marketplace. It too sells
products people want to buy for their specialized needs. In that
respect, Sun is very successful in its market.

>similarly small market -- and there are others. Are any of these companies
>or product lines a failure as a result.

The definition of success or failure depends on many things.
Obviously both TI and HP consider some of their products to be
successful since they continue to sell them and to introduce more
models. Other products are dropped from the product mix.

One thing you can be sure of though, if no one bought a TI calculator
model, it wouldn't last long in the marketplace.

It wouldn't matter what features it had, or what CPU it was running,
or how loyal the people who might have bought one felt about it. If
it didn't sell, it would be dropped.

And they certainly wouldn't introduce a new model unless they felt it
WOULD sell, and they had researched the marketplace to be sure.

My questions about the intended market for the "$300 Hackers'
Computer" are along the same lines.
>
>If you want to by your dime-a-million VCR's and Wintel computers, be my
>guest. If you think that our discussions are illconceived, so be it. But
>if you are more interested in tearing our designs apart than contributing

>file, and forget this little band of crazies exist.

Like I said, discussions like this can be interesting and can expose a
lot of people to concepts they might not have thought of otherwise.

But part of discussing what might make a successful new computer has
to be a discussion of what made earlier attempts fail.

As much as I loved my Atari 800, I know why it disappeared from the
stores, and why my Commodore 64 fell from being the most successful
computer in the world to a $5 thrift store white elephant. And, I
know why the other computers I have now have succeeded.

>

> actually sold?

Getting even farther from the original topic. It is quite easy to have
a "kit" computer for next to nothing. Here's my current little kit
project...

http://www.oz.net/~otter/gallery/Thissle.JPG

This is eventually going to be a dual-boot Linux/Winblows-98 beast.
Here is what Thissle currently has:

ISA/PCI motherboard
Intel Pentium-120 CPU (Socket-7)
40 MB RAM (72 pin SIMMs - 4 8MB SIMMS and 2 4MB SIMMs)
256K Cache
Hard Drives:
IDE x4 Quantum Fireball ST3.2 3.2GB
Western Digital AC-2850H 850MB
Maxtor 71260AT 1.2GB
Fujitsu M1636TAU 1.2GB

SCSI Quantum ProDrive LP240S 245MB

CD-ROM Chinon CDS-53S
Colorado-250 Tape Backup Unit
Standard 3.5" HD Floppy Drive
Trident TGUI-9680 PCI Video Card - 2MB
56K Modem - ISA

AMD AM-2100 NIC Card - ISA
Adaptec AHA-152- SCSI Card - ISA
SB-16 PnP - ISA
Nice SVGA PnP monitor
Typical 2 Serial Ports and 1 Parallel Port
She still has 2 empty PCI Slots

Right now, I'm just messing around with her Win-98 side, mostly for hardware testing, and for teaching myself networking. The Network hub sitting next to her will be used to link her and SunBlossom (the P-166 system I'm posting this from) together, as soon as I find the documentation for the hub.

All total, I think I have at the most $25 to $30 invested in her. The majority of her components were given to me from friends and co-workers who know I like this old stuff, with the rest being purchased from thrift stores.

I think this definitely qualifies as a "kit" computer, or at least as a "geek station". :) She's got enough to be operational, with plenty of room for upgrades and expansion as super cheap components become available.

Now as for the original question that started this whole thread...I'll have to think on that. Should make good bathtime thinking material later today; or goo drifting off to sleep thinking fodder. On that note, it's time for me to get some sleep.

Night all.

Maybe I should have left more context in, because I'm trying to figure
out your implication.

My recollection was that the KIM-1 was a popular computer, though
at a time when popular didn't have to mean a large quantity. At
the time it was sold, it was still early in the cycle of small computers.
People were still wanting computers because they had always wanted
a computer (something a few years before was an impossibility for
most), rather than because they had a need to do something with
a computer. So the low cost, for the time, was to many more significant
than the fact that it lacked memory, etc. In fact, the KIM-1
wasn't all that limited for the time, remember the Altair came
with something liek 256 bytes of memory. To get a computer
"that did something" you'd have to spend considerably more.

And of course, some people took their KIM-1's and made them into
full-blown systems, with video boards or dumb terminals, 32K of
memory, disk drives, and all kinds of things.

I have a KIM-1, got it in 1979 (late for the time, but clearly
way before most people got computers), so I'm biased. But my
impression is that the KIM-1 was an influential system,
coming between the S-100 systems that started it all, and
the all in ones that came in 1977, like the Apple and the Radio
Shack.

And now I'm really curious about your impression of how many
KIM-1's were sold.

Michael

Agreed.

>And "kit cars" cost a ton of money, and hardly ever work right.

This is true only if you are not mechanic enough to assemble it correctly. For example, A hopped up Myers Manx could beat $25,000 or $30,000 Italian sports cars on the race track back in it's day. In 1968 a $30,000 car was _supposed_ to be a lot of car. (But seldom really was.)

And, a kit computer is worthless only if you lack the ability to assemble it.

>You can ride to the Space Station if you have enough millions.

I hope my new program for picking lottery numbers works!

>But can you build an obsolete hackers' computer for only $300?

You can buy an obsolete hacker's computer Goodwill or some other thrift store for a lot less than that.

BTW, I am posting this from a Windows box, but still enjoy just fooling around with an old 8-bit computer almost every day.

Best regards,

Sam Gillett aka Mars Probe @ Starship Intrepid (972) 221-4088
Commodore lives . . . . . if you call 1200 baud alive!

Just who is this $300 computer being buildt for?
some geek who likes 3" thick manuals about command lines
or who wants to play with electronics?
or is it for the people who can not afford the fancy computers
if its for the last you have to make the OS simple along the lines of Mac
or Geos or you will not sale many if its hard to use. and your stockholders
with not be happy.

> Or did you mean "I can find something a bit like it somewhere else"?

I mean verbatim what I said. Name your specs and I'll find you a PC.
you want QNX? NetBSD, FreeBSD, OpenBSD, NT, Windows (MS), Solaris,
SCO Unix or Unixware?

If the OS is available, it's available on a new PC.

<disclaimer> (and this isn't a cop-out)
This does not include asking for hardware and OS combinations where the
OS doesn't support the hardware you asked for, then claiming I lose
because said hardware won't work, ie: asking for AmigaOS for the Vic-20.
</disclaimer>

<good faith>
I won't just say it's available, I will point you to where you really
can purchase the machine, and actually get a quote for the machine, with
your OS of choice installed, at a very competative price. If you need me
to show you the actual quote to prove it, then so be it.
</good faith>

Not much good at all, I agree.

This is why Microsoft has been so successful, people don't know any better, some people. It has very little to do with availability, or any other notion that "you can't get it" (the competitors product.)

That however, would be ridiculous to try to pin on Microsoft. (although in our courts, anything's possible ;) I can see the headlines now: "Microsoft charged with having customers who don't know any better, Microsoft denies charges, plans to appeal."

The truth is, the customer has choice. If he can't make an informed choice, then maybe we should make more effort to inform people of the choice they do have.

You could get "98lite" which is a piece of software that lets you do a number of things...

1) Install 98 without IE.
2) uninstall IE from a preinstalled 98
3) install 98, and IE, without integrating them.
4) deintegrating IE from a preinstalled 98

You don't need to use this product though, as you can do it yourself if you feel comfortable juggling system files. I might try to dig up the instructions for the DIY method, if I get a chance.

What on earth gave you the idea routing was hard in Linux? IME, it's
a damned sight easier than in anything from MS. It's even easier in
OpenBSD and Solaris.

> wierd protocols like PPPoE)

I see no point in PPPoE. Why would I ever want to use it? I'm not
even sure what uses it other than some broken cable modems used by
inferior providers of no service worthy of my consideration.

I guess I'm a total novice about DSL. I have cable, and my Linksys Router/Switch came with directions about setting up PPPoE, but seemed to imply that it's necessary for DSL. I certainly don't need it with cable.

Maybe that sheds some light on this sub-sub-sub-topic?

Actually in my area, it's DSL that uses PPPoE...Qwest does it with
some internal DSL modems from Intel so they can turn off the
connection when the person isn't surfing the 'net.

Of course, you can get the DSL without having to use that, but it's
an extra $10 a month plus you have to pay for the modem...they give
you the Intel internal modem for free...

..."are things usually done by someone who should probably spend a
little time learning anyway."

PPPoE is used mostly by DSL providers.

It's a pain in the butt to do in linux, when you have multiple distinct
PPPoE clients that must be routed securely, not just "NATting" them
together behind one PPPoE interface to the DSL.
```

As far as there being no point in it, if you get stuck having to do it,
you have to do it. (and it sucks)

Gregory,

That conspiricy theory sounds like sinclaps usual tactics in his self appointed job as unofficial MacVidiot. Notice how the vidiot stated tech tv dissed atari yet also states they never mentioned atari. One cannot insult atari by saying nothing.

Hey Dunny

Don't waste our time. You have not proof. I've been programming and working in electronics for years not only as a hobby but also in my career. I am quite familiar with the intel, 6502 and other processors. You simply cannot effieciently emulate one cisc process on another. Its physically impossible.

Bob,

I've made the rounds of nearly all the emulators. No fallacious arguments to say software emulation is easy or stable can hold up to scrutiny. take a close look at what you need to emulate a stock 8mhz ST on any PC, it isnt the least bit realistic on anything less than a Pemtium2-200 and certainly isn't stable. Risc processors have a better time with emulation but don't even try to waste more of my time saying any intel processor can do a good job of it. It simply isn't bact up by any fact, and likely never will be.

Utter nonsense.

The architecture of the Z80 (used in the Spectrum Dunny referred to) and
x86 have a common ancestor (the 8080) which means you can produce some
very effecient emulation because many things, like flags etc, are very
similar.

So how is it that by sitting in front of a pentium 150 I can run JPP or Realspec (slowly) and play a nice game of cybernoid? Hmm? You sir, are talking out of your bottom.

For more proof, visit www.worldofspectrum.org and see what a KNOW LIAR you are.

Trivially false, because it has been done.

Recent kernels can be compiled with their version of GCC. When RedHat 7.0 came out this problem did exist indeed, but it has been resolved by now.

Gcc 2.9.6 was the most stupid thing they have done in years anyway. But apart from that I find RedHat quite usable, although not perfect. But who is?

Ok. look in your crystal ball... how many people will get a linux PC when they
walk in Fred Meyer over a Windows PC?
They get the PC, then ask to look at the software section, or maybe ask if
they can run the same software they saw at their friend house.

I'm sure it better today and you dont have to spend a week getting a dev environment
to get basic tool to work. But its still a far cry from the software you get under windows.

Like you hint, the guy probably dont know linux.... can you imagine the guy walking back
asking for basic question as to why his new directx game wont install, or how does he
setup the new usb scanner he just got... or import his digital camera images, etc.. etc..
etc..

We are talking about 0.000001% . Thats why Dell droped the ball on linux. They dont offer
this as an option anymore. They realized that linux market is super specialized server and
hacker.
And hackers build their own PC's :)

BTW, I beleive its possible to have API like directx working on linux... So 'pure' directx
dev
could be ported in a snap to linux, but who we spend that level or R&D for those linux
user?

I think they took it like "Remove your network stack, bad bad boy! you are a monopoly
you can integrate a network stack!" and from a totaly stupid request they just said "no
cant do"
because giving a valid answer wouldn't have made a diference.
In my view MS is really down at many people like they are technologie moron.

Anyway, lets look in 5 year as to what OS WONT have an integrated HTML 'parser' in the OS
as a base API service.
Should the US gov (and tax payer) bring to court QNX, Beos, etc.. ?

BTW, what happen when you type a ftp or http address in an explorer windows?
If you install Netscape can you 'fix' the now broken desktop and allow for those space to
be browsed again?
Who make 'namespace' http support for windows?

Anyway... time will again prove MS right and linux will follow.

Stephan

> Why should they have to though? What extra power would my parents get (word
> processing, internet, dtp, spreadsheet) by using Linux over Windows or her
> Mac (actually my old Mac)?

None if they can use Office/Works already. I would give the Unix
Office applications a year to become functionally more useful than the
MSOffice equivalents. By more useful I don't mean that they will do
everything that the equivalent MS program would do, but it would do it
correctly. Office has so many bugs it is unbelievable. Still, large
software programs have bugs, so the Unix Office apps will get them as
well. I just hope that the emphasis for the Unix Office apps is going
to be stability and bug fixing over feature bloat.

The Windows interface is just as confusing to newbies as the Linux one
(say, KDE). Except that KDE comes with a whole pile of apps
preinstalled for free, KOffice, Konqueror, silly games, etc. Linux is
just a mess under the surface though, and the surface is dodgy. For a
home user desktop, it needs a single, consistent interface, easy to
configure printers, hardware, etc. MS is way ahead in these areas. QNX
is the best alternative desktop OS I have seen to date.

> What advantages would I have in using Linux over
> Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder,

VB - MS Technology
C++ Builder - Borland
VC++ - MS
JBuilder - Borland
SQLServer - MS

You would get none, of course. What advantages would I have in Windows
over Linux as a server programmer using Perl, PHP, Python,
PostgresQL/Oracle/MySQL?

> And there are not dozens of known security holes in most Unix/Linux

Hence you should use the more secure alternatives with length
parameters to prevent buffer overflows, such as strncpy.

And in particular, scanf(), gets(), sprintf(), strcpy() are not OS
functions but C runtime library functions, and the security holes
within these functions are present in *all* C runtime libraries,
including those running under MS-Windoze....

scanf() in particular is useless for anything but quick'n'dirty
throw-away test programs, and should never be used in a real
application.

I think it is the IIe emulationm chip. It says Copyright Microsoft 1978. Aaagh!

I'm not the originator of this message, and no, I don't have such a list. But there is one very annoying aspect to MS Works. To my knowledge, there are no other word processors or spreadsheets that can import files saved in the proprietary MS Works formats. True, you can export from MS Works if you know in advance which other program you will be using to work on Works files, and that program is on the list of "save" formats in MS Works. But it's darned inconvenient for people who start out with Works and then want to use something a little more elaborate.

But now we are WAY off topic!

i was in a comp u.s.a. today to pick up some mac stuff for my sons g4,
and i gotta tell you it was bleak, there was nothing that he wanted, we
were told it all had to be special ordered. the software selection is
almost non-existent.
it reminds me of the atari situation in 1992.
i think that the new amiga clones, and tos clones might help save
apples day. this is something that i repeated before. at least it will
help apple in the production end because any addition to volume will
help them out, plus there might be cross platform written software.
there is a mighty loyal following still on the tos, and amiga market,
though small still anything will help all 3 survive.

I would go for something very simple: a very compact hand held or palm pilot type machine with a 6502 or 65816 CPU, either 4 or 8 megs of RAM, 320x200 / 640x400 LED display, a GEOS or Palm OS type operation system: it would include both a kernal layer and a GUI layer so that the GUI can be shut down by a program. It would be a machine that could be used for something like a Gameboy
or a Palm Pilot but would include lot of IO ports for external extras like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM, printer ect. and can be used as a simple home computer or web browser as well as a control module for other hobby projects.

I would also include a built in assembler and another simple high level languge like BasicX (which will allow inline asm like Turbo Pascal does).

Oh, yeah... if possible I would also include network support so that these hand held computers can be chained together. Maybe infrared IO too.

> I would go for something very simple: a very compact hand held or palm
> pilot type machine with a 6502 or 65816 CPU,

Or for $10 more, you could have a 200MHz StrongARM processor or similar in the device, along with easy, cheap support for the interfaces you list below.

I like ARM processors, and really want a fast XScale based laptop or computer. Not much chance of getting one soon though.

> either 4 or 8 megs of RAM,

For a handheld device, low power memory is essential. Hitachi just this week released an 8MB memory chip that uses 30% less power and is even faster. Given the cost of memory, it makes sense to hit the sweet spot in price rather than the cheap spot, and I imagine that could be 16MB or 32MB. Which is a lot for a handheld device unless you run WinCE. Which I wouldn't want at all. So lets spoil ourselves anyway.

> 320x200 / 640x400 LED display,

If you have a keyboard on the device (like a Psion palmtop) then a 640x240 half-height display (Psion 5) or 640x480 display (Psion 7) would be great.

Without a keyboard you would have a conventional palmtop display of 320x240.

> a GEOS or Palm OS type operation
> system: it would include both a kernal layer and a GUI layer so that
> the GUI can be shut down by a program. It would be a machine that
> could be used for something like a Gameboy

Palm do have a very good frontend for launching software on a palmtop device. The software choice is very good as well. The underlying OS is a bit didgy though, but they are moving to ARM, so hopefully they will sort these things out and get a solid OS in there under their GUI stuff.

> or a Palm Pilot but would include lot of IO ports for external extras
> like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM,
> printer ect. and can be used as a simple home computer or web browser
> as well as a control module for other hobby projects.

Yikes, where to put the ports on the device! I suppose it could have one of those laptop bay-extender thingies, which could have a DVD/CD drive, HD, etc in it.

Wireless ethernet would be a very useful feature.

Mouse wouldn't be necessary with a touch-screen system. A small portable printer for the device would be neat though - an A5 printer :) Still "neat" is not "needed"! Audio recording and playing is necessary, as is decent video, which palmtops really need. How about some 80's style graphics hardware trickery! Sprites, hardware scrolling, block mode graphics, etc, but with a 16-bit screen :) - then again, the GameBoy Advance has that and more now... maybe some lowend 3D hardware instead!

> I would also include a built in assembler and another simple high
> level languge like BasicX (which will allow inline asm like Turbo
> Pascal does).

That would be fun.

Graham

Which CompUSA? Did you try Micro Center in ST Louis Park via HGWY 100
North off 36 West/Excelsior? Also, the Apple Store is opening at the
Mall of America on Saturday which is suppose to carry from 300-600
titles. Todays Star Tribune has a piece with picture of new store in
the Business section.

Any news on the new Amigas such as release date? That will be
nostalgic from 1985...the good ol days..when AmigaWorld and Info
Magazine were anticipated. Also, the Atari rags were pretty good as
well with lots of focus on the small developers.

There is a FREE IDE interface for the Apple II being planned on
comp.sys.apple2. It uses 7 74 series chips in the prototype. The prototype
works. People are now trying to improve it to automatically recognise tracks,
sectors, heads etc. So the rationale is sound for a niche computer.

Utter crap as usual. I never went around claming atari revivals at all. Whenever I or anyone else calls you on your many lies you resort to lyinging. Btw, the only bigot here is you. You continually insult atari users in atari forums. It is YOU who does the attacking. And only you blowing smoke out of your lazy ass.

> He he he.. Oh sure like you know..
>

I do happen to know whats going on. Thats why I nor anyone else takes your BS as anything other than a pathetic joke from a pathetic loser.

> My posts have legs. The difference is the bigit ignorance..

Yet again you spew crap.

You getting tired of me telling you this? perhaps you should stop spewing crap if thats the case. Btw, Your making claims about what I've said in the past. You're also basing your fallacious "story" on ignorance of how the computer industry has been working for the past 10 years. Only one platform is covered, and its not your beloved mac.

Perhaps that statement was worded poorly. The situation referred to is often called "M$ tax." Will M$ let you install a second OS along with theirs?

Be found out the hardway about all this when they tried to license their OS to other hardware venders. (Dell and IBM probably smell blood with M$ recent problems with the DOJ).

6342. If you could design a $300 homecomputer today, what would you choose?

I really wouldn't design a $300 home computer. Way too many models of home and "productivity" (read Palm) computers out ther. Let's focus on the hobby computer. Why is the hobbist so underestimated and underpriced today?

The Ideal Hobbist computer would be an Atari-like portable computer. CPU? maybe Z80 or 6502 derivative. A low power RISC or CISC Chip, but powerful enough to avoid the flickers and glimpses in audio and video. And it must have a modest enough memory space for you to write neat apps that don't need 3 CD's to install, but cartridges or Smart Cards.

Since no HD or CD is desired, SmartCard or PCMCIA or FlashCards are desirable as storage media. Also, the back panel must have serial, parallel, and "user" ports. User port should be an Atari, CBM or Apple flavor. So every pin of the CPU and every usable signal in the system is available.

Language? If BASIC is not allowed as the main language, then it should be the rapid prototyping language option, accesible thru software commands or a small switch. But BASIC MUST be included. The main language could be Pascal, but remember that rapid prototyping means no time for detecting every single variable to declare.

Video? Well, since our system is intended to be a field-usable system, an LCD is mandatory. I don't think an SVGA resolution is needed. But a VGA is desirable, and a quarter-VGA is good enough. We want to test system parameters, sensor response, GPS tracking, missile trajectory plotting, or just fish bank detection to be instant represented with our supercharged Game Boy, right?
But remember, we are planning a Hobby Computer, so most of the graphics could be displayed in a TV. Composite Video and VGA outputs are the only two choices.

Audio? Well, it must be CD-quality. No more, no less. Remember we cannot hear beyond 20kHz, so why should I buy a computer able to emit a supersonic or subsonic sound I can't detect? Well... Maybe for Dog training or Subwoofer testing! But anyway, CD is just what we need. And complete control over the waveform thru software.

Internet? Yes! A 10/100 base T interface so I can connect my hobby computer to the local net and download any data I gathered in the field. Just like an internet "appliance". But this could be added with a PCMCIA card.

Maybe what we're trying to figure out is a new, VGA, networkable version of the Radio Shack Portable Computer sold in the early eighties, with an open, well-documented architecture. I can see it: in one hand my hobby computer with a bunch of cables attached and a piece of custom hardware sending codes to the machine. Or maybe, a credit card interface attached to an electronic cashier just like in Terminator 2. Ooops, there are some disadvantages, but just don't see 'em.

I think I'll start designing it, since a computer like that is for us, the inhabitants of the dark, underground world of electronic hobbists. A customizable, in-house expandable, easy programmable box that can be instantly attached to any project just to test or diagnose or in-system emulate. But then again, it sounds like my old Atari!

Microsoft's EULA only restricts how OEM's install Windows, and software "into Windows", and has no control over the rest of the product. They can't tell us not to install Linux alongside it.

Wrong again. Your crap bit the dust. How do we all know? cause your the last of the kooks who try to bs people here. Btw, you never did give a real reason why you don't visit mac.advocacy at all. Truth is you never have. You haven't been busy since you've never left your parents basement for years. The reality of it is you aren't a mac advocate at all but rather a pathetic loser who attempts to bully others. Its unfortunate the pommelling you've taken over the years hasn't yet taught you the futility of your lies, arrogance and outright stupidity.

nope, he's quite ahead of it. Conrad "Tubby" Black thought he had the drop on Jean, and look what happened - he had to sell the National Pest because, despite all his lies and his attacks about Jean (just like a certain fake "Apple Power Rep" in his attacks on "Atari Jihads" who are "out to get him") they all fell apart like a deck of cards. Tubby has now left the country with his tail between his legs, blaming everyone but himself.

And now look at TiFKAS - once again, trapped like a rat, it has to go and try to attack an entire country in order to feed its frail little ego.

And , of course, the real reason TiFKAS is too chicken to go into mac.advocacy: thirty seconds after it opens its big yap and puts its foot in it, it''ll be reduced to a pile of onion rings by .advocacy's denizens. Indeed, one true Mac advocate there who's seen TiFKAS in action has advised it to buy a PC and mirrored glasses with the mirrors facing inward so that it can finish its metamorphosis into a Wintroll :)

TiFKAS will, as usual, deny all and start replying to his imaginary friend "Chunks". Dance for us, monkey boy.......

having just gotten my Handspring Visor Deluxe, I decided to see just what was out there in the way of programs, and particularly those E-Books out there.

well, I just happened to go onto the Aportis website (they make a document reader for Palm OS) and saw they have an E-book section.

Wouldn't you know it - someone has come up with an E-book History of Atari, from Syzergy to Hasbro, for free download! And it's pretty good, too. Lots of info and fun facts about Atari - did you know that they sold 350,000 copies of Tempest 2000 for the Jaguar? They also talk about the Atari computers, from the 8-bit to the Falcon

If you've got a Palm or compatible and want to check it out, go to http://www.aportis.com/library/index.html and click in the Computers section. You'll need an E-book reader to load and read it.

BTW, the Visor Deluxe is pretty good, too - they've just discontinued it, and so you should be able to grab ahold of one of these for a good price. I got ahold of a refurbished one from the Handspring web site for $119 US + free shipping. This thing has as much RAM as my TT does, and it's turning out to be pretty useful for work-related stuff. Now I'm getting ready to order a digital camera Springboard module for it :)

What does Conrad Black have to do with Chretein being last of the
major world leader to visit down south? Sheesh, even the Japanese PM
was there before up north.

Sounds like you and Conrad share something...

From: "Vladan L." <vla_dan_l@yahoo.com>
Message-ID: <5k4nrtcvqg7bbt30vjgftu5krhvae1tqga@4ax.com>
Source record: 736

Hi, First time I write to this NGs.

I gues this was asked too many times already, but here it is...

How to attach PC mouse to an STE.

I've even found an old 3-button mouse with a large serial connector to it, and ST software supposed to do the thing, but...

I plug the mouse into MODEM port, *.prg runs from a aUTO folder and....

Left and right buttons do work, but it won't follow the moves. Ocasionally a pointer will slide down and to the left, out of the screen. Reminded me of a bad cable thing, but ohm meter showed cable is o.K.

I don't have original ATARI mouse at all, but have the working body of something called "Beatle mouse" (only cable and the jack are missing). It has 8 pin connector inside, as oposed to original 9. If someone could give me a hint where to look for a pinout scheme of this mouse, that could be the easiest way.

Thank you.

Vladan L.

The best way I know is to do what I am doing now and that is to use
Mario Becroft's PC serial Mouse adapter. I use it on my Hades to use a
Logitech mouse. Works great... Try this site for more information:

I advocate you cherish Atari history by bidding on my fresh and styling Atari Super Pong console.

Very sweet. Simple game, maximum playbility.

It's on ebay. Item # 1282105090

Also Atari 2600 ("Darth Vader black" version), Atari 5200 w/carts, even an odd item like Superman Spinball Pinball (looks and is a strange thing to behold).

Anyone know the web site of that guy who will custom make a Atari 2600 cart (text display)?

Bollox again. I've even posted about you there, I've posted TO YOU there, and you never reply, you never defend the macs from windroids. jThere fore you are still a liar and a blatant scumbag. Not that its a surprise to anyone. For the record everyone here KNOWS you don't visit csma cause you idea of "defending" the macintosh is limited to spewing crap at others while hoping that nobody will realize your a pimply faced loser without a life.

Why should I care that wintel users do not use the Apple platform.
It's there loss not mine. I suspect that the new Apple retail stores
will attract the fence setters and the low hanging fruits.

So what crap have I spewed?

millions in the technology field know how to spell. Unlike you.

> You sound like the class wise ass, always perfect...but rediculed..

no, they laugh WITH me, not AT me. With TiFKAS it's the opposite.

BTW, it's spelled "ridicule" . Come back when you've graduated
remedial kindergarten....

> > yes, TiFKAS, we all know about how much you like to "Palm"
yourself :)
>
> You must of erotic thoughs about being 'Palm'. You thought of it first

hmmm, not only can't TiFKAS spell, he also can't put together a
coherent sentence! Having fun with your old friend Johnny Walker again?
:)

> > it did - the whole book is tull of the facts about Atari - and
proved
> > that, as far as your disinformation campaigns, you're full of it.....
>
> What disinformation campaign?

well well well. Remember "98% of all Atari applications fall over on
the Milan" ? Remember "Pointcast will completely destroy Atari from
the Internet"? Remember "I never said Calamus was crap"? Remember "I
never said that Steve Jobs would destroy Apple if he ever came back, or
that I called him an arrogant bonehead"?

> > You're certainly not serious about getting ahead and bettering
> > yourself, can't even spell "ecstatic"
>

I have bettered myself, pinhead. Last March I got a promotion, a raise, and some additional employee training which has now added to my resume.

You'd be lucky if you were able to sell pencils from a tin cup, much less getting any job in the computer industry.

> *note, sinclap maybe absent due to sending back the field PB to former
> employer..

well well well - someone finally noticed your shoddy work and gave you the boot. That's what you get for acting as much the fool here as you did in the field.

BTW, can you now give us evidence of who formerly employed you? Or are you still bound by a "non-disclosure agreement" (read: BS) that prevents you from sharing that info, O former fake "Apple Power Rep".

Lets take stock of this right now. Has anyone here in the atari groups or in mac groups (that you never post in, yes I've checked) ever agreed with you? NO
Has everyone you've ever communicated with in this newsgroup or any other called you a brain dead idiot? YES

Btw, since your American (which is acceptable on its own) and Incredibly Stupid, in fact the Taliban would either laugh at you or at the very least insult your lack of intelligence.

>
> Care to back this up. What have I stated that is crap?
>

I don't have to back up the fact that your an ignorant liar. You do such a good job of that yourself. Such as your blatant lie in this very post that your an Atari user. Take a hint, atari users don't spend their lives bashing atari computers and other atari users.

Theres also your bogus claim to attend tradeshows including Macworld in NY and SF. Despite the fact that you've never been seen there by anyone. The mere fact that you can claim to be there and be totally invisible to the thousands of attendees is absurd to everyone but you.

And lets not forget your laughable attempts to delude yourself that you want to be an "apple power rep" in your professional capacity even after its been proven many times that you've never worked for Apple or any Apple dealer.

You see, it goes to your own credibility. You make wildly stupid accusations against others. Then you contradict yourself. To top it off you wont provide evidence when pressed repeatedly. The result of this is you're universally recognized as an utter fool.

> Whats there to post? It's an advocacy group too, plus I am a Atari
> user as well.

You an atari user? absolutely not. you've disproven this many times with your egomaniacal diatribes bashing atari users over the years. Yet you continually claim to be a mac supporter. This is not born out by any facts, in fact your own statement above proves quite the opposite.

"whats to post?" you ask? despite your claims to being an apple user you never venture into any of the mac newsgroups defending apple from the mac bashers who spew the same

idiotic BS that you mindlessly fire off at Atari users.

The facts are that your simply trying to inflame people against each other. But your silly little school yard bully plan is foiled by to blinding facts. (1) Your stupidity is so obvious and self contradictory that it invalidates itself (2) More than a few of the people you bash are at one time or another people who've used both Atari and Macintosh systems. In essence your attempts to provoke Mac and Atari users against each other are attempts to get people to attack themselves.

No you have NOT posted in CSMA, ever. Yes I've checked, So do Dan and Razor (and I know who they are, personally, so unlike you they're not liars). The REALITY (as opposed to your moronic fantasies) is that you don't take part in CSMA, EVER!!! you don't even go in there. The proof of your sad lies are in the plainly visible evidince is that when called on your lies in the atari groups you reply within hours. Yet when I, Dan or others call you on your crap in CSMA or other mac newsgroups you never respond.

Hey numbnuts,

Get another clue (or another brain cell your choice). Pornography isn't sex, it isn't even a substitute. Porn is a lame 2 dimensional pervisity much like you are. Perhaps if you could ever find a girlfriend (which is an outrageous stretch of the imagination, even for you) you'd eventually figure out the difference between porn and a really good thing the rest of the world calls having a life.

Atari is now owned by Infogrames and the did pay a few million dollars for it together with assets of Hasbro.

Are you willing to pay this amount of money for Atari? Hmm that would be cool... let us know what you're up to..!

Hmmm, Hasbro had the home system rights after they bought it from JDS, they may have sold it again but I cant remember the name of the company at the moment. It would be good if something materialized other than just another port of old arcade games to windows.

That was JTS that sold everything to Hasbro Interactive.>they may

>have sold it again but I cant remember the name of the company at the moment.

Infrogrames recently bought Atari from Hasbro Interactive.

>It would be good if something materialized other than just another port of old
>arcade games to windows.

Since Infogrames is a games company, it's highly unlikely you'll see anything
but games with the Atari label on it. Atari as a company - at least as we knew
it - is in the history books.

Hey, Baiz! Wanna plot the next Atari revival again? :-D

Actually, if anyone is willing to listen to my ramblings... Atari's revial COULD happen, albeit without the name Atari. Remember "Neotari" ("New Atari", get it?)? Well? What's the diff if people run/port their apps on the Neotari [whatever], which would be a PowerPC based computer running FreeMiNT (and a proprietary GUI) or a genuine new Atari computer (which is about as likely as water becoming dirt, these days)?

The whole Atari scene is dying and not a whole lot is going on to stem the tide of death washing across the landscape. I still say we ought see if a USA-based Atari "clone" effort (properly devised & supported) would work. But that means more than me. That means people working together for the total project. A single aim. A single purpose. No divisions of idea or concept. The leader of the project would be the final say-so on everything. That's what a CEO does.

It takes imagination to create a BeOS (thank you, Jean-Louis Gassee'!). It takes imagination to save Apple (thank you, Steve Jobs!) Never say it can't be done again, because these two people have proven that it CAN! It just takes people willing to believe that what one person believes in, CAN happen and WILL happen.

The IBM publicly-available POP designs and Bill of Materials for the latest version.

For this stage, I need someone (or a couple people) who are familiar with PCB layout/design.

For the next stage, I need someone (or a couple people) familiar with programming MiNT, FreeMiNT, SpareMiNT, etc.

And, does anyone know if/where a generic Atari ST emulator is in the PowerPC sector? Source code is a necessity and a person (or persons) who can code. The original programmer would be best.

"All it takes is just a few people to start agreeing..."

BeOS is dead and Apple market share is tiny... you where saying?

6420. Any attempt at Atari revival is IMPOSSIBLE!

Newsgroup: comp.sys.atari.advocacy

From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <bRjD7.309$rP2.19017823@news.incc.net>
Source record: 685

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, ha d some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

Hi Jared,

I do like this project your proposing. And I have one very practical reason for doing so that you havent mentioned. I am not just an diehard atari user cause I like them on their own. But I also have very valid uses for my Atari gear. Every day I'm using one of my atari machines for not just "fun stuff" but for doing real work on, not because they're the latest machines but because they get the job done reliably which is more than I can say for most of the windows based machines I've used over the years. And no silly irrelevant buggy emulator offers the same functionality comes close, period.

ttyl,
James

To prove that such an effort CAN be done, just go to:

http://www.beunited.org

These are a group of people trying to save BeOS by *licensing* the source code *from* Palm. Assuming the sale of Be's IP (Intellectual Properties) goes through, we're all hoping they succeed.

All I want to do is license the brandname "Atari" (and access to all computer-related materials, schematics, source code, etc.) for use in re-creating the computer division.

However, aside from the relative "simplicity" of this plan, we need to find out just how many people (current and ex-Atarians) are willing to go with this plan, provided they realize that the name and the products that go with it is what this plan is all about.

Yea or Ney. Yes or No.

There are other aspects of this plan that are pointless to even mention until we know just how many are willing to commit to the plan and put their name and Email address in a list (petition).

The first step is to marshall our forces. Once we can show just how many are going to be involved in different aspects (buyer (i.e. end-user), hardware developer, software developer, OS programmer, etc.) of the plan, we find out what we need to do to aquire the rights (a license) to use the name "Atari" in a computer division. It may require money up front or be part of a "per sale" arrangement (I'm hoping the latter).

I'm sure setting up a site where people can post their name, Email address, geographical location, and "position" (what aspect they want to assist in as part of in the plan), is a good idea.

Like I said, we must be resolved in this effort. That this is the ONLY way. No arguing about how we proceed (suggestions are welcome, however) or getting two or three steps ahead of the step we're in.

Nothing can be accomplished until we aquire the rights (a license) to the name "Atari" and permission to use it to start a computer division. But, in order to do that we must be united in the "how and why" of what we're doing.

If we don't do this right, they'll probably never even consider it. And, even if we do, they may not consider it. But we have to give it our best shot. If we never try, we can't *possibly* succeed.

Afterall, we can't be any worse off than we are now, can we?

In case there is any misunderstanding of my plan, let me clarify.

The name, "Atari" means nothing. It has no value. Just like "Jared". Just a set of letters coupled together to form a word. It's only when you make an association to something or someone that it has any meaning at all.

My plan is not to license the name "Atari" purely for the sake of the name. That is as pointless as what Hasbro and Infogrames have done.

I truly hope, if anyone from Infogrames is on this newsgroup, they don't become offended, because I believe what they are doing is nothing more than "software prostitution". They are simply pimping the name "Atari" for a few dollars a night (figuratively speaking), based solely on the "recognition factor" alone. Hasbro did the same thing... and look what happened. Now Infogrames is hoping to do better than Hasbro. Will they? Who knows. One could hope, but I seriously doubt it.

When I see the name Atari today, I see nothing. I see a Hasbro or Infogrames game with a vaguely remember name tacked on to it. Sure, it's *supposed* to instill a thrill or sense of nostalgia that will make me want to buy the game. But do I? No. And I probably never will. Why?

Because there is nothing BEHIND the name. No product. No substance. No value. A name without a person is a word. A word without a meaning is babble. Babbling is pointless, useless noise-making. How often do you thrill to hear someone babble? Me neither.

I want to bring MEANING back to the name "Atari". I want people to remember that the name Atari MEANS something. It means uniqueness. It means pride. It means computers.

When you look at a game title on the shelf today that has the name Atari on it, do you honestly believe Atari produced that title? They didn't, because they don't exist anymore. They only existed when they made arcade games, game systems, and computers. All it is is a brandname today. It has no substance behind it anymore. It's a ghost of a word, no longer holding any of the pride and fun it used to represent.

I want to change that...

ah, once again TiFKAS, having nothing to say, attacks the Simpsons.
well, TiFKAS, seeing as Homer is now officially recognized in the
dictionary, I think it shows well that they're respected in the culture.
When will you be in the dictionary - when your picture appears next to
"idiot"? :)

hmmm, no, that's up to YOU to prove your claims, not me. Many Milan
owners found quite the opposite.

You fail to see the point about PointCast - you brayed loud and long about how the technology would force Atari users from the net. Instead, Pointcast crashed and burned, and we're still here.

ah, once again TiFKAS attempts to attack the labourer as being unworthy. Remember, labourers and salespeople make a great part of an economy and their money buys computers - which means they pay you wages, pinhead.

You stated it not me. True, that these market segments power the
economy. To bad, that a greater precentge of their income goes to
taxes than the higher incomes who pay less. So who gets screwed? And
why nothing has changed?

Speaking of...Any up northers want a bat ball franchise that could be
extinct by next week? Imagine, the Up Norther Twins...

Just if they would be willing to consider licensing the Atari brandname and assets related to it.

However, if Milan (as to what they say on their page) truely DOES own the rights to TOS, then the ONLY thing we ned to license is the brandname from Infogrames! We can make a separate effort on Milan for TOS afterwards...

I've already Emailed Milan about their claim concerning TOS. No reply just yet.

That would be a dream come true, but I doubt if it would happen since
they are just a gaming company. Surprises me that they would not be
interested in the Jag and Lynx, especially the Lynx since it it much
better than anything else out there. They should consider making a more
portable Lynx. That would give the GameBoy Advance a stiff competetion.

More correctly, they are a game *software* company, not gaming
(hardware/software) company. If they were a gaming company (like Sony, Sega
(R.I.P Dreamcast, you will be missed!), Microsoft, or Nintendo), they WOULD
be interested in the Lynx/Jaguar. But they're not, so they're not...

Which is where WE would come in... if they'll let us...

It would not to suggest that to them. There is a first time for
everything. I know a portable Lynx (that fits in one's pocket) would
catch on fast. So how do WE come in?

Infogrames does not make game hardware with the Atari name on it, they program/publish game software with the Atari name on it. Where we come in is to create the game hardware with the Atari name on it. And the computer portion of that same area is something else they're not into.

Think of this for a moment... have you seen Splashdown over at www.atari.com? Have you seen Transworld Surf? Or Transworld Snowboarding? Now, imagine those games on an Atari console... Atari on the games... Atari on the console. Perfect match. And Infogrames is making money in both departments! Theyt make money from our profits and they make money from their profits. It's a double-header!

All we'd be doing is sharing the name "Atari", because of it's recognition factor. And, the fact that we liked the computers Atari made before and want to see them continue.

Jared

I own a Lynx and have played around with a Gameboy colour and the Lynx comes
out looking decidedly old hat. A Lynx isn't going to impress anyone these
days, no matter how small you make it.

Regards,

Clockmeister.

Oh, but WE'D make it the size of a woman's watch (with Swiss accuracy, of
course!)! That's just GOTTA make it better than a Gameboy Color! Uh,
doen't it? (laugh)

Sorry, jeweller's magnifiying glass (required to see what you're playing)
not included. :-)

Is something wrong with your eyesite??? I am telling you the Lynx is
far better than the GameBoy Color. I took the Lynx with us when we took
my son to Indy for a day. There were ALOT of kids interested in it and
mothers were asking me where I got it. I admit, the feel of the Gameboy
Color is superior to the Lynx's feel and it's portagility rocks. Now
the Gameboy Advance rocks and rivals the Lynx. Give the Lynx a
re-vamping too and you will have one great portable game machine.

Not in the least. I call you a Scumbag since you are a scumbag. If you had any functioning brain matter you might
figure this out. At the moment, I'm not bothered by your stupidity, in fact I'm getting quite a laugh from you.
I've gained endless laughter from watching you singlehandedly trying to outdo Beavis & Butthead singlehandedly.

> Guess again...I have..No support for spammers..
>
>

There is no guessing involved here. At the beginning of this thread you insulted me for berating a spammer flogging a
pay per vew sex site in an an atari newsgroup. You see I don't deal in guess, only FACT. I've told you this many
times before and you're still far too stupid to realize it. This is why you don't realize your moronic ranting is
also nothing to do with this newsgroup. if you take a close look you'll see this is not "alt.wanker.bitch.whine.moan".

>
> You must have a web cam to dwell in your imagination. The ones who

Again you resort to pre-adolescent fantasy. You've just reiterated one of the sure signs of KOOKdom. You've just
accused me of projecting. Yet you're the only one here defending a porn freak. You've also avoided the question of
why you need porn instead of getting a life and a real girlfriend (the rest of the world knows why, but you are still
unable to admit it).

You should hear the comments I receive from friends when I show them your incompetant spew. They laugh at you as
loudly as I do. So far the kindest comment about you they've made is "What a F**KING

RE***D!!!" in between fits of
laughter. Another swears I made you up as some sort of odd joke insisiting anyone as moronic as you could survive
anywhere in society without someone kicking the crap out of you on a daily basis (personally I wouldn't bother,
you're too much of a laugh).

>

HAR HAR HAR HAR. It's really hard to type this from laughing so hard at you!!! You're such a vidiot!!!! you actually
think that I or anyone else actually believes you. Here's another clue for you sinCRAP: you cannot see or hear tones in a
usenet posting. What you're reading is ascii, go look it up on google (go now I'll be sending you there again in a
minute). Lordy your stupidity is truly hilarious "calm wisdom" are two separate things that you have never possesed. You
started here years ago screaming insults at atari users, whilst in an ATARI newsgroup!!! and now your defending a porno
pervert spammer. Now you entertain the world by claiming to be "calm" and "wise".. You should send your resume to the
BBC, you'd be the perfect target to Lenny Henry's sarcastic humor in his next series.

> Beavis who? You might one to refer to your bunk roomie chunks' on
> this..
>

Something else you can look up on google, that series that was made as a documentary about you and your imaginary friend
"chunks". You should get some real friends, a real girlfriend so you don't hafta rely on your buddy "chunks" or on the
netporn you've been looking at for years. With your lack of personality and delusions this is impossible.

>
> There is a difference. I never stated in words that I supported that
> particular spammer, just your conneption on sex...Read with meaning...
> A clue will be realized...
>

Yep, another lie. I'm not surprised you've been doing it for years. And if you did get a clue, it would be the first and

only time in your pathetically funny life.
Btw, this is the part where you do some more searching on google. search the newsgroups (this one specifically) for your
previous posts. There you will read your own defense of a porn freak spammer. Your next job is to go to amazon.com (no not
the "erotica" section you've been wasitng your time in) and buy yourself a dictionary, thesaurus, and the full set of
"hooked on phonics". After you wade through all that, which at your level if intelligence will take years, you'll realize
there is no word "conneption". You should also focus on words such as "Troll", "buffoon", "Pathos", and don't forget the
one thats most descriptive of you, namely PATHOLGICAL LIAR.

>
> > "alt.wanker.bitch.whine.moan".
>
> Been there?
>

Yes you have!!!!

> Did no such thing. Need to read AGAIN what I said..
>

YAWN!!!! this lie of yours is the one part of your sad pathetic existance that bores everyone. You said and did exactly
that. the only one lying about it is you.

> Now there is a claim that you have friends to divert that you have no
> one except for your bunki chunks'...PUleaZE,,,you alleged to have
> friends and show them what you do on usenet. What a luZer I am!

Remember I told you to try "hooked on phonics" not "hukt awn fonix". you really need to improve on that single digit IQ of
yours. The only downside instead of being humorously pathetic, you'd just be a total bore (but then people call you that
now).

Btw sincrap, I have REAL friends, yes I actually know REAL PEOPLE. I don't need your want your imaginary friends "bunki"
& "chunks". Btw, my friends weren't laughing at me. They were and still are laughing at YOU. Thats the funniest part,
your so gormless that people repeatedly laugh at you and call you moronic to your face for all your whining, screaming, and
lying and you still don't get the point. You're the ultimate 21sth century example of "The emperors new clothes".

And whenever you do come crawling back to expose your ignorance of the real world under the light of reality you should
explain that if you still claim to be a macuser (while acting as wintroll provocateur all along), why haven't you defended
the mac in the csma newsgroup. (btw, your singluar post claiming "hey everyone look one message makes me a csma regular"

doesn't exclude you from this question).

Tifkas, just because your in the catagory of "moron, 3rd clas failed" doesn't make you sane, it just lets the world laugh at you
all the more.

> To many untrue assertions above...You have a wild imagination. I Must
> be a loner roll playing type..
>

Yes tifkas your assertions that "pointcast will destroy all atari users" which you repeated ad nauseam, even after pointcast was
long gone. Or your imagination that Dan Dreibelbis was a character on the simpsons. among many others that will be featured in
the alt.loser.tifkas.faq

> Read again. There must be a language barrier with meanings hat must
> not compute up north..
>

I have read, tifkas, you have not because your incapable, that is the only language barrier. But expecting anything else of

you is expecting too much since you do none of your thinking north of your beltline. Not surprising considering your IQ is
measured in nanometers.

> Here I go again. A pathetic attempt to prove....
>

You have nothing to prove. You know nothing therefore you lie to make yourself feel important. Too bad for you that lies cannot
be proven.

> Don't need to defend. If folks want to spend hours on tech support
> with Dell, thats their business.

Its certainly not your business. You've never proven anything you've said since you've lied all the while. Everyones known for
years that you know nothing of the computer industry since you're not part of it. Years back when you claimed to work in "A major
university IT department" you started making your wild claims. You still haven't realized it but thats when your house of cards
fell down. You couldn't identify where it was that you worked, and when people started checking, it was soon uncovered that you
didn't work in any university or anywhere else in any computer related capacity. You're just a loser who is bitter at those who
do know of what they speak.

Are you still here displaying your complete ignorance about the video world? You haven't moved on YET?

You can't find anything better to do than post your moronic macparrot drivel on an ATARI newsgroup?

Man, you are sorry.

It's the same TIFKAS who said years ago that Avid was dead. Guess what? They live!

How many major feature films were cut on Avid this year? Too many to count.

How many were cut on FCP? Er... none that I'm aware of.

I suppose you must have missed the DV Mag review of the Avid Express software only editor... at $1500, DV mag rated it much higher than FCP. Oh, unfortunately it's only a PC app.

Just so you know, I LOVE FCP, it's a great app... but don't believe idiots like TIFKAS. Remember, he's the moron who never heard of Pro Tools (the MOST POPULAR audio editing system in HISTORY) yet was talking smack about audio.

Post # of 112380

Schiller talk ...
I went to the Phil Schiller Keynote at DVExpo and here are a few notes
from what I saw.

First, the room was standing room only and had seating for about 500.
When asked, about half had already worked with Final Cut Pro.

The talk started with the ususal review of Apple strengths, such as
Gigabit Ethernet, Huge Ram and drive capabilities, and the Titanium
was continously mentioned as a possible edit platform. He went over

the fact that iMovie and iDVD were the number 1 "civilian" editing programs for movies and DVD. [The audience was almost 100% serious DV people, and then there was me.]

He mentioned Final Cut Pro and then introduced Jean-Pierre Isbouts, who created a TV show "Walt: The man behind the myth" (Walt Disney) completely on a Macintosh using Final Cut Pro. He had some 75 inteviews, which occupied 35 hours of film, along with another 30 hours of background material. He normally doesn't do editing, but, in this case he wanted to and Final Cut Pro allowed him to do it completely on his Macs.

Then Phil talked about OSX "the first UNIX for video pros" and talked about how media is at the core of the os [Quartz Compositer]. He then introduced Final Cut Pro 3, the new version for OSX. What's new, you ask? Well, FCP3 is the first program that allows Real Time Effects completely in software. Specifically it can do transitions, Title, and Color Correction. In addition there is a new codec in the Program [OfflineRT] which allows high compression of original video for work offline (read that on a Titanium). So, instead of 5 minutes of original video per Gigabyte of Hard Drive space, the codec makes that 40 minutes of Video. That means that a Titanium can hold 24 hours of raw video on it's hard drive for editing.

Then there was a demonstration of FCP3 (on a dual 800) doing all of the new items above. In a typical Macintosh fashion, he took a piece of DV that was way too blue (no white setup) and with the new color correction panel, made it usable. Then, because there was another cut from the same camera setup later in the mix, he simply cut all of the color adjustments (many, many color adjustments) by pressing a button in the program and instantly adjusted the other clip, even though it was not sequentially in the movie. Ohhhs and Ahhhhs. Then they showed a transition, with a title flying in from the right, all in real time. More Ohhhs and Ahhhhs.

FCP3 will be available this month, and the upgrade will cost $299 ["Less than an iPod", per Phil]. The Full product is still $999

Then Phil introduced JJ Abrams, the producer of both Alias and Felicity. JJ went on to tell the tale of sitting in an editing booth with his editor and trying to edit a fight scene from Alias, and just not getting it right. He downloaded the clips to his Titanium, flew to the East Coast for a wedding and on the trip back edited the sequence on his Titanium. He then returned to the editing booth and showed the "amazed" editor exactly what he wanted.

After JJ Dave Trescott of Adobe demoed After Effects, doing some incredible scene insertion while the main sceen was panning.

This was followed by Mike Evangelist, the director of Apple Pro Applications, demoing DVD Studio Pro, the OSX edition, which will be released in the 1st Calendar Quarter of 2002

That was about it. I heard people discussing how this and that hardware/card manufacturer were going to be in real trouble. Apple appears to be doing fairly well in LA LA Land.

YOU ARE A STUPID FUCK. Pro Tools is NOT the standard on Windows, moron. Again, the more you say, the
more you look completely ignorant.

You are trying to look knowledgeable about audio and video, but you don't have a clue. Twinkie, give up
on the audio/video world. You have too far to go to catch up. Stick with the Macparroting in general,
and don't get specific... you'll be much better off.

>
> Remember...it's in the software stupid!'' Not overpriced
> dinosaurs....

Well, it's the RELIABLE software, and it's the FAST software, that hollywood needs. If you had a clue,
you'd realize that movie studios don't care about spending $100k on an editing system for a $30 MILLION
movie, if it's faster/more reliable, which it currently is. Duh, stupid fuck. FCP is great for the
money, but it STILL doesn't have a titling tool that's even useable. Yea, I'm going to give up my Avid
for it? Right, twinkie.

Hey Petey boy,

You know for such a slow response you certainly had enought time to come up with a new set of lame excuses.

Peter Sinclap wrote:

> Just condemned about all on usenet including your fellow jihads...
>

BS as usual, you must come up with a new one, the only "jihad" going on now are 2, one involving dustbin laden and the other in your
petty little thing you still call your "mind".

> An expert on losers? I am the one who is bent out of shape and
> foaming..Just cool and calm...
>

No you're memory is gone too, faking forgetfulness won't fool anyone Tifkas. We're all laughing at you, have been for a long time.
The more you throw your little hissy fits, the lounder people will laugh at your lunacy. If it wasn't for your insatiable obscenity
you'd be a regular feature on the comedy network. But since they only require literate people who refrain from public consumption of
hardcore porn, you're disqalified from that. Not surprising considering your rather empty career to date.

> Just described myself. Who is jumping up and down while foaming?
>

You are, the more the rest of us laugh at you, the more looney you become.

> The world is defined as 162 countries and six billion folks. I doubt
> that many are following this thread. Quit assuming...
>

Yes you should quit assuming, thats all you've been doing, arguing against already proven fact with nothing more than your laughable
idiocy and your imaginary friend "chunks". It's very telling that of all the population of this world you're only friend exists only in
your mind.

> I doubt that many Atari users are using the fuji computer as their
> main internet surfing tool...That includes chunks 'Dreibelbis'...
>

More than you can count (not surprising since you lose track after running out of fingers to count on). Go ask Alexander Clauss. If

you really were a Mac user like you'd claimed to be all these years you'd know who he is and how he would know.

Btw, I know who Dan Dreibelbis, he isn't your buddy chunks, you see Dan is whats known as a REAL PERSON, not a sock puppet or your
imaginary friend.

> Whats nonometers? Wha measurement formula do you use to compute, or
> is this made up from the cartoons?
>

No Tifkas, its called a Unit of Measurement, I'll even give you a clue this time, It's Metric. You've once again unwittingly revealed
your total lack of education. Perhaps if you did bother getting any education, perhaps you wouldnt be so completely illiterate and
functionally useless

> what lies?
>

Everything you've ever said. Thats why you wont' bother heading to google to check the archives of your previous posts. You keep on
lying to everyone and then lie again claiming "Tifkas never said that"

> So your denying that users don't spend hours on tech support with Dell
> and others? well i got news for you...
>
> Oh that was a thorough search indeed... nuff said..

Again you FAIL to duck the point. was a measly few weeks ago you were still pretending to be a mac user rather than the pathetic
wintroll that you truly are. When challenged as to why you never defend the mac on the MACINTOSH NEWSGROUPS, you posted one single
solitary message in csma claimign "see I do post in a mac NG", and then once again dissapeared. Yet you continue to plague other
newsgroups pretending to be a mac user by idiotically trying to insult everyone else with your whining. The net result is you, living
alone in your basement, all the while being laughed at by everyone for your blatant stupidity

I've recently heard the google archives have been updated to go back to 1981 now, not that you'd find so much from
that far back since its long before most of the internet was publicly accessible. But then Tifkas will claim thats
when "he invented it" no doubt.

Well I really don't care what you do in the bedroom with your imaginary friend known as "chunks". Thats not surprising though considering
that since you've spent your adult life in mcdonalds manning the fry station. It goes a long way to explain your preoccupation with your
imaginary friend, your preoccupation with online porno sites and your general lack of hygiene. Take the hint tifkas, those things callled
SOAP and WATER will help clear up your complexion, and your filthy bizzarre mind (which in itself wont take long to clean on account of its
small size)

> Oh oouuie...Did chunks' brain farted on that?
>

Since chunks is your imaginary friend that explains the foul odour emanating from your mouth every time you start ranting. You should change
your tin foil hat to the larger size, perhaps when you take your annual bath, that should cut down on your pungent emanations.

>You may have to read above for meaning and style...So who is giving 'hissy fits'?

You of course, thats why everyones been telling you that for YEARS!!! why haven't you figured it out yet? most likely cause "Hukt on fonix
werkad fer tifkas".

> chunks' exists. You should know...he is close to you at all times.
> Sheessh...fighting your bro battles that he can't finished..
>
>

Chunks exists in your imagination. btw, your imaginary friend is close to you alone. you don't live near me, I'd spot you miles away fromt
he toxic fumes emanating from your unwashed mind. You've just proven that chunks is your imaginary friend by calling him my brother. Anyone
who has a clue realizes I dont have a brother (theres your problem again, you don't have a clue). I'm not surprised you don't know where
your imaginary friend is. after all it was you who, less than 6 months ago, claimed minnesota was 300 miles north of china while trying to
deny that you live in your parents basment.

>

Why should I do your homework for you? its much more entertaining to laugh at your obvious bollox cause you cant be bothered to know of what
you speak.

> I never said he is my buddy, but he is yours in a bro way...
> Sound like you and bro compare you know what under covers ...
>

There you go witht he porn again. I've told you to cut down on the fries while your working at mcdonalds and to start bathing, then you
might have a real friend someday instead of relying on the online porn

> I supose working in a hardware store will give you a legg up on this.
> but market dynamics is out of you and bro leagues..
>

HINT: leg has one G. (there you go with your "hukt on fonix" again).
you should take note that your job as part time fry station cook at mcdonalds will teach you NOTHING about market dynamics, thats why you
still don't understand the subject.

>
> Sounds like generalization without substance..
>

Yes perhaps you are starting to see what everyones known bout you for years, you generalize without knowing the facts while foaming outright
lies to cover your ignorance. You've had this hint before: check the google newsgroup archives. it goes back far enough to include everyone
of your lies such as "pointcast will destroy all atari users" and "atari jihads are out to get tifkas".

the Milan was out for quite a while before a year ago. several have them. Same for the Hades. My first use of a hades was in 1996. The
sucessor to the hades is in development now. If you'd take a look around instead of sticking your head up your fat ass and blowing your
brains out when you fart, you'd already know that.

> Thats news to me. I swear that I have an iMac/ibook wireless/dsl set
> up at home while typing this.. Could be delusional...-) Don't think
> so.

Since you've spent all your time attacking other computer users and never once attempted to defend the mac against your fellow wintrolls &
sock puppets (all 2 of them) its become clear that you don't have a mac, and never have. You're an obvious wintroll who's shallow flatulent
tactics have failed. But not without providing hours of laughter for those who see you as the clueless ballmer groupie you've been all your
life.

>>
>
> Oops..Pro Audio...Your attitude makes you silly.

What are you even saying? You are smart enough to not elaborate because you would display your ignorance yet again. It appears you are learning something.

There are several DAWs that are much more popular on the Windows platform than Pro Tools. Pro Tools is only the "standard" on Macs.

> Sounds like you can't take it anymore. Defending the Avid purchase
> arn't you?

Er, no twinkie. My Avid has been paid off for several years. I just bought a new dual 800/FCP setup BTW, so why would I feel a need to defend my Avid purchase? I could decide to sell it tomorrow if FCP was good enough, and I would lose nothing... heck, it would get me some more money for other studio purchases, I'd love it.

There's a reason I haven't done it, twinkie.

> Of course your not going to give up on the Avid hardware since the

Yea, read the paragraph above again. You really are a moron.

My Avid works.

My dual 800/FCP setup would no longer capture without dropping frames after I installed FCP 3. This is a simple DV stream, 5 megs a second

tops. This is trying to capture to my Medea RAID, which can handle 40 megs/ second without breaking a sweat. Oh, and it's also the same FCP that has such a crappy titling tool that it requires me to use After Effects for all titling.

It's about reliability, twinkie. FCP will be a threat to Avid when it works reliably.

BTW, I'm sure you heard that Avid has announced they are going to release a software only Xpress DV package. It will be interesting to see how many people bypass FCP altogether now for a more complete package for $500 more....

Pro Tools is the standard in digital music production and is used in
the majority of recording studios across the country. Notice I did
not say "your house" because on the PC platform there are simpler
packages for the casual user. Pro tools is not meant for playing with
MP3's and swapping music files. Pro tools has a high learning curve
and generally tends to separate the novice from the professional. The
majority of studios I have been in do use Macintosh setups (and
usually dedicated ones) however I have seen many PC's that use Pro
tools also. It is not simply the standard on Macs, it is a standard
of the professionals. And it has won a Grammy award!

"Digidesign's Pro Tools evolved from a four-track computer recording
and editing system in 1991 to today's premier multi-track digital

audio workstation for professionals. Designed by and for musicians, Pro Tools has forever changed the art of making music and is now at the forefront of the industry's top recording studios. Pro Tools provides the professional music, film, video, multimedia, and broadcast radio industries with CD-quality digital recording, random access editing, advanced signal processing and digital audio mixing applications.

Digidesign's innovations including Time Division Multiplexing, Real-Time Audio Suite, DirectConnect and more have revolutionized the industry and paved the way for widespread use of digital audio workstations(DAWs). Pro Tools was used extensively in the production of Carlos Santana's multi-GRAMMY winning Supernatural, as well as in recent recordings by Ricky Martin, David Bowie, Mariah Carey, TLC, Nine Inch Nails, Garbage, Beck, Limp Bizkit, Kid Rock, Everclear and Wynton Marsalis to name just a few. Pro Tools has also figured prominently in the post-production of many motion pictures, including Titanic, Star Wars: Episode I The Phantom Menace, and American Beauty."

Nuff said!

It might be the "standard" for music production, and low end post.
There are other packages that are also very popular for post.

Thanks for the post, but you missed the point... Pro Tools on Windows is
NOT very popular. There are much more popular systems on the Windows
platform.
